Colornag-matrers whichentect mordant, are called substantive colors, while those which require such ail are called adjective. The exact way in Which dye-stulfe act npen fibrons materials lias not yet been investizated as tully as it deserves; the generally received oprinion is that the fibre has ats affinty for the
coloring-matter in the case of substantive dyes, and for the mordant. which in its turn has an uffinity for the coloring-matters of aljective dyes. Another opinion is for an insolotle lateo in the case of the murdanted dyes. However this nuy lu it is curt in that different mat rials take dyes in diff-rent proportions. Thue eilk and wool take the anline dyes in the nost perfect manner but cutton requires the interveation of a powertul mineral or animal morident. The oprrationa that take place in dyeing are, mordating, ageng, danging, dyeing, and ciearing. The principal murdants ased are alumina, ex tensively enployed for woollens and silks in the torm of alum and cream of tartar; and juroxide of iron, which
is nuch used in the torm of protacetate for logwod and is much nsed in the torm of protacetate for logworiand
m -ulder. I'roxide of tiu and sereral vther metallic oxm -ulder. Proxide of tin and several other metallic ox-
ides are used lor the same purjuse; also nlbmmen, caseine, and other aninall substances in differont furms. Aker the fabric lass leen mordanted, it is generally hung up in a room through which a current of etram and air is passing, by means of which the nnion betweet the filire and the mordant is quickened very considerably. The cloth is then dunged, in order tos renove the superflnous morilint not absurbed by the fibre. This was formerly effected by passing the filre through a mixture of cow-ding and witer; but this filthy operation bas been supurseded in a preat measnre by the introduction of what are terned dung substitules. The priacipal dung ondstitntes in use at present are the ar6eDic, arseniate, und silicate of soda. phospbate of lime,
and canstic soda. The action of these is chemical where st that of the cuw dung wis suppused to hemerely pucchanical, by enmply ing the unabsorbed poordant wit a fibrous material in a turm state of division. Dungin is one of the most iuportant processes is dyeing great care being taken to keep the danging-liqnor at a proper stredgth iod temperatore. The next process is the dye ing proper, which is effected by rumuing the fatric throngb the eolition of the dywstnft, the color being modified, more or less, by the nature of the mordint nsed. It wonlit bor impossible in a short sprace to give an account of the differmit methoiss adnpted of dyoing different colors; but a description of the meens used to produce the more commbis colors will he interenting to or calls, with mu iron mordant Commom black milks sre dyed with lorwond and fratic iron beine used as a mordant. The larat milka are dyed blawk on a blue ground Woollen gomle are firat dyed bluc with indigo, and afterWards with mamach, logeond, and ereen comperat or sulphate of copuer. Cotton and lisen goorls are dyed black in a very similar natnopr. Cbromate of potash is also sometimes usad with logwood: jractical dyers bay that it pussosacs no great ndvantages over blue or green copperia. Bhues are produced fram indigo, either in the
f.rin of anlphate or in aqueous solntion. Prussian blue with a porsult of iron or tin as a morihnt, gives a very phlenhat dark hluc: and, of late, ecereral blued of novel
 Jogworl, with is tul norilint. Fine crimaion purplea are ohtifnod from aniline, and are known under the popular mante of makenta. The mest important yellowe dyer are quervitron, tuntic, turmeric, nrnotto, und French or Perwhan berries. Jy combining theme difforent colorn, and ly whutiniz the murdants, colorn of every conerivable mhate nath line are ensily obtabued. When the faloric hise received the color intended, it is washayl in a eolution of santp th which a little alknh han been ndeded, atter which it la lailal in water with ar withont the sublition then nald to Ine fant, whirb means that it will not he wishod ont. The chemintry of dyelog has af late yeurs rearhay lumble known. that can be exerted by the human frame, nuimals or onachinery, whether by a single effort of strength or by
 time. In extimating the anoont of work perturned live power by means of a maclune contrived for any motive powar by mesans of a maclune contriven for
the purposi, we have to consider the force that has been applied and the space through which thas furce has been exerted. If a horse pull a humbred-weight ulong a mite
of liel gronnd in half an hour, or lualf a butheret-weight over two miles in the same time, ho will have berformed the same anonut of work in both cases ; but ir he continue to perform the same task for an hour io either
case, it is manifest that he will have done double the case, it is manifest that he will have done double the
quantity. We see, then, that the amount of work done must be estimated by the force npplied to accomplishit, and the space of time for which the application of the force is kept ap; in other word, it wice of time thro agh the force exerted miftiplied hy the space ortina thro agh racy, a $D$. is required. The simplent kinds of these instroments are tibose used to determine the force which any min or animal can exert by a single effort. They vary considerathly in form, as the furce happens to lie applied to the machine by tellsion or pressure, or by striking it with the clebched fist to determine the
weight of the blow that a person can duliver. The amount of power exerted is indicated by a nemdle moving along a horizontisl or circular scal. Fige S89 showa

Dysenter'ic. Dysenter'ieal, $a$. Pertaining to ysentery; accompaniet with, or procemang from, dysentery; as, dysenteric symptoms. - Suffering froon dysDysentery, $n$. [Fr. dysscnterip, from Lat. and $G r$. dysentrina-Gr. dys, mucons or boody stools, attendel with gripine pains in the abrlomen, straining. and tenesmna. It differs from diarrhoea in that, while is the litter the stools are fecal, in this there is a retention of the natural ferees, or they are expelled from time to time in suall, hard, separite lumps, termed scysalr. D consists essentially in inflim-
mation of the mucous inemlirane of the largo intestines, mation of the mucons membrane of the largo intestmes, anith fever. D. is one of the pests of hut climates, ind in all tropical countries, at certain seasons of the ymar it is very prevaleot and destructive. It is, however, among flects and armics that this malady most displays its deadly power; so that it has lieen termel the scourge of armies and the most fatal af all thrir disedsirs. The
forms of this disease, and the circumstances under which forms of this disease, and the circumstances under which
it prevails, are infinitely varions, and many speculations it prevails, are infinitely varions, and many speculations
have been formed rogardiog it. It is now a primary, have been formed rugardiog it. It is now a primary, has been uscribed to exposure, to wet, ant to cold; to the use of unwholesume foral, to the atency of malaria, of this disease ocrur in warm climates, and in situations where the body is exposed to extreme alternations of heat and cold; and hence there is ev-ry reasm to heli-ve that these iofluences are largely concersed in its pro-
dnction. It is dombtin, however. whether the usi of uuwholesome food or natarious poison wonld iodoce it
as a primary disense; and the general opinton among medneal men is that it is not contughns. Wenerally one
of the earliest bympteme of $D$. in an mieasiness of the of the earlest bympen, shon mumonting to pain of a pripumg clurncter
 parthatariy in the umbilical region, attendens witn hit evacasthon. As the disetase becomme developed, the relief is but tramient; thet desire to go to stool is more frequent and importunate; the disclarge is scanty, und what is voiled is either nitegither it jelly -like mache or, moie commoniy, it is mucoms und bloody - the
bloody-flux of old suthors- mixal with films und mem-bloody-glux of old nuthors - mixal wills films und necm bramous shreds and tragments reselablitig thesh. Th scunty evacobanols now jroduce dastres rather than there is still som thing to come uway, the expulsinn ot there is still some thing to come nway, the expulsing ot

given alternately, and comblined with sheh Hocdicunts as given alternately, and combintiont should le 6 wathed promote perspiration. The alutomen should the 6 wathed
in flamel, and much lwent masy le obtained from the eoployment of clysters, if there is not too muels tencemins to almit of the intrumation of the pipe. The food Ghould be firinuteeons nul sumple, and great care muet be token dming convaliscence to prevent a retarn to Bi.jproper diet, and any frish exphsute to cold. They are aonual plants, with leaves mustly opposite and pinnately parted or toothed; heads paniculato or corymibysodilfe. $n$. [Gr. dysodes, fotid.] A combustible moer, fivand is secondany limestene, of a sellowish color, either compant or in fuliated masses which ars
composed of paper-like ant flexible lamina, with imcomposed of puper-like ant thexible lamina, with im-
presoions of fisles and pionts. It burns with acrackling presise, giving off much flime, and it very foetid staell.
 Dysug'sy, n. [Fr. dysopsir.] Dimaes of the eyesight Dis appetite.
Dppepin. Dyspep'sy, $n$. [Fr. dyspopsie, fron Uir dy*ppszu-dys, and peas $\overline{,}$ luter prpsō, to digest.]
(Mod.) Bud digestion; podagestion, or dathenity of diges(Mod.) Bud digestion; iodagestion, or difticuity of difes-
tion. It is by means of dhestim thit the fuod which is taken into the stomich is converted into ontritiv matter for enpplying the waste that is constantly going
ou in the system; lience anythag thot iotcreaces with the due suppiy of nutritive mutter, muterially affect. the system, and may introduce a long veries of ilis. The compliated series of oporations hy which dizestion is carried on reuders indigestan mie of the most prevalent of the ills to which humann flosh is subjuect-it is the prevailing malady of civilized city life. It is io the stonaach, as is well kurwn, that the princip il clange is effected io the food. Whatever food in taken into the stomach, theres is in the natural state a secretion of gas-
tric juice, which wets chemieally upon it, und by which tric juice, which nets chemiently upon it, and by which it is dissolved or cunverted itato chyme. While thas
process is going ou, it is facilitated hy it sort of charaprocess ing revolving movement of the stonmeh, and at leagth it passes liy dugrees throngh the piluric extrem ity of the stumach into the intestines. D., theretore may be vecasiooed by a leficient supply of gastric jnice so that the food is not properly diseolvel, or from a to torpid or too irritable condition of the nanscular filare of the stomach, in consequence of which tho chyme is detaioed too long, or ejecteal too soon. A weak dyspep tic stomach acts very slowly, or nut at all, on many,
kinds of food. They mudergo sponthnecus changes, promoted by the mere wirmuth and molisture of the
 perhaps, the half-dizested mass is at lemith expelle: by
vomitiog, or it parscs, undissolved, into the duolemm, and lsecomes a poncce of irritation and disturbance dur ing the whole of its passuge through the inteatines. One of the most frequent signs of inligention is a los of appetite, no desire for fount, or. perhaps, even an at solnte repugnance and discust it the very thought of eating. Sonutimes the appetite is cupracious and un-
certain, or may even le morbidly craving and raveous.

SUPPLEMENT.
lish g overnment. After his return home in 1836 , there appeared in rupid succession trom his pen: Jowrual of
Researches mto the Gevlagy and Nuturul History of the tarious Countris visited by H. M. S. Beagle: the Struc ture and Distrabution "f Coral Reefs: Gimhngical Ohser vationts on Volcanic Islands; Nouograph of the Fumily Cirrhipedia: and The Fbssil Species. In 1 N59 he published his Origin of Species by Means of Nalural Ntec the scientifie world. passed through many ethtions at the scientifie world. passid cirough mand entitions a home and abroad, and gave rise to guite a war of con-
troversy. In 1862 he brought ont the Fertitization of Orehids; and in 1Ni7, Domestic Amimals and C'ultivated Plants, or the Pinciples of Vuriution, Inheritunce, Re version, Crossing, Inter-breeding, and Slectan, under Domestication. In 1871 thera appeared his seconi greatest work, The Drsont of Mas, and Neleclion in Relation th Sex ; and in 1872 , The Expression of the Enst tions in Mun and A nimels. D. is a member of the prin cipal scientific bodies of Enrope.-The Theory of Derelnp-
ment, or Darainimm, as the doctrinal views lielt by Mr ment, or Dardinith, as the doctrinal views helt by Mr
$D$. have lecome pupularly termed, are looked upan as Denerial principtes, on $\mathbf{w}$ accepted as determined and eg generid principtes, o w scceptel as determined andes by Prof. Inveley io his $M_{\text {In's }}$ Place in Nature. The dominant fentare of the Darwinian Theory must be found in its substitution of natural canses for super natural volitious - its main thesis being that the or gin of new species minst be weconnted for by natural canses alooe. Mr. D. does not claim to have discovered sll the "Natural Causes" of which he treats ; especially does he svow his ignorance of the calles of "spontaneous variations ${ }^{\text {a }}$ in organic forms. He does nut assert
that the theory he evolves is the complete explanation of the origin of species; but, says. Mr. D., that it is true as far as it goes is beyond the power of catulid investi gation to dispute. The hypothesis of miriculoas crea tioo, as recorded in the Book of Genesis, is one which has now become very g'perally discarded in scientific circles, and one which its warmest adhwrents eveu hesitate to dissect in detnil. Animats and plants, the two
grand divisions of organic life, are each divided and

 Man, for insturser, it stands nos a notable thet that all
 serves the phace of the coudal approthige foumd in siut lar animals of the sumur grous, but lelonging to dither ent specties. The promlaritacs adafted to some partient lar locality being thas tostered by circomastances und transmittial tu offiprimg, grow mure marked, antil after shectssive genelationsa new nnimul wombluplobir to have been created. The harwintan theory manitains that mun mast by no movis be considered an execption
to thix commun history: aud in this it is -upportex toy
 nent of living comparative matontists, who,
etrating the allumee of Nam wath the Apes and otrating that 'ulutever sy comparison of therr modibictuons in the aje encries lead to one and the same resnlt; that theniructural differences which sejarate Man from the (inrilla nud Chimpanzee are not so great as those which seynarate the Gorilla from the lower Apes. This themry in mbstintially the same, therefore, as that advanced by Mr. D., who hold that man in both heminghered is dessereded from the Batue stock whence the existing Cutyrhine or old worl munkeys have been derised, and he trisers these hatter bock throngh a various ancestry to marine antimals re sembling the larre of existing Ascidnans. - In the De scent of Mitn, the anthor proceeds to discoss the wvi has ur luwer aniuat furm one to which his ow a prcsent Has of lower anmma form, one to which his ow a present
entire structure is immediately comparable fs with entire structure is immediately comparable as with developed embryonically in a like ratio.- Ile alsu compares the relative mental powers of the lower suimals as compared with those of man, and deducts for the latter a matared and develnped intelligence which is fonnd io its rodimentary stste is the first-named, The moral sense of matukiad, toro, lue clams to bprink from a combination of activity of intellect with such social instincts. He next proceeds to trace the suecessive stares of name development from the lower ant (so to spiak) he urgex must have occnrred anterior to the dispersion of the haman rice over the world. Then Mr. $D$. presents his theory of the special effinitios of man to the lowersaimale, by which the genealogical line of ascent may he followed as far as time and place of his arigin, together with the nature and probsable origin of the scveral races of man. The latter point brings the anthor in drect contact with the considerafion of sexaal selection - which bratich of the sutiject is discussed and treated most elahurately and at great length. Fioally, the cunchusion, led incontestably to by the prembes, maintains that Ban-whatever onay tre physical - has in lis loodlly frame the infatlible char physical - has in lis loodly frame the infetlible char
setera of a lowty origin, wo removed bat in little from the inferior orders of the brute criation. The latest works of $D$, are " The Phuer if Mirement in Plants," (1850) and "The Firmation if Fegetable Mould through the Action of Worns," (1881). D. April 20,1882 . Iredel

Devede
Devo
Devilojment Theory, (The.) (Biology.) A themry armunally proponnded by the anthor of a work entilled the 1844 . In this work the Huthor of Creation, philili=hed in lift. In this work the anthor frst statey ally on the gloles. With regard to animal life, and arguing from fossil remaine, he places the order or pro grission as followa : - First, an era of invertelorate animals ; second, a period dwring which fishea were the only vertelrate form of being; then a period when refo (ites warp reen in addition, hat withont birds or mammaslia: next a time whin the last were added, hut without hata; and finally, the present era, in which that master species has existed in suprembcy over all. Taking creathin, then, as it lirosd collrse of progressive organization, the theary of development is thos set forth:-All anicell, of which it is impusaible iu why ease io tell to whie form it is destined to udvance. A series of clanges takes place, by the carefin examination of which it is impossible to determine to which class the future aninall or vegetable will beloog. Accorving to the thesiry as enunciated by Von Bar, "an heterogeneuns, or special stiucture, arises ont of one or more homogeneons or genersl, and this by a gradnal change." At the same time it is contended that the embryo of each grade of being passes through the general conditions of the embryue of the grades beneath it. In en eubiryo of the vertebrate sub-kingdom can be traced the clasge which will determine whether it will belung to the filh, reptile, bird, or mammal class. In un embryo of the mammal determined; sall afterwards those of the fumily reuns species, sex, sul individual in succession. As an illus-tration,-"There is no easential difference butweun the vertebral columin of the varly embryo of man and that of an embryu fish; the evolution of the nervans centres begins, in both, en the sante plan; so also doex that of the cirenlating apparatus." Consparing the clangee through which the embryo passee, with the history of the general life of tos glove, s strong sinnilarity in the plan is to be ohserved in the individual life of every one of the forms of organized beings which now people it. There has been a suceescion frum invertebrate to vertebrate; from the firls the the reptile, from the rep-
tile to the biril and numnal; in the manmal finally to nife to the biri and mamonal; in the manmal fiablly to from this part of the argument, the filluwise liyputheais is put forth. That a chearico-electric opuration hy which germinal vesicles were produced, was the first phenomenon in organic evanten, aud that the second was an advance of these through a encerasion of hipher grades, and a varify of modificatoons, in mecurdance with haw uf the sume nhantute natnre us those hy which the Almighty inlem the physicm dejurtment of nature. The theory of rimicpuant was stringly and stily op-

## Drake, Samuet Gahdvis, htl American author, B. Bt

 I'ttsheld, N. H., 17:8. His best kuown works are Indiun Bingraphy (1852), und The Bouk of the ludians,or Hindory and Bugrophy of the Jodians of North America (18:33) D. 1875.
prake $e^{\top} x$, in Tramexser, a dist. of IIardeman ce
Drake' $\boldsymbol{W}$, in Trwnekse, a dist, of llardeman co,
I)rama, n. (Lit. Hivt.) A poem or piece composed for the stage; a compusition in dialogne, in which the netion is recited and represented, nod nat related. The
love of imitation is inherent io human nature: and the fove of imitatiog is inherent io homan nature: and the first evidence of intellect given by a child is his as
amption of the manuer and beariog of some other persoll. A w ith iudividuals, so with Oations; and almust every ancient and madern civilized people have cultivated dramatic representatian in some form. The Hindoos sud the Chinese lave a rich store of theatrical works; aud in Chioa the love of dramatic exhbitiou is a perfect rage. Aceording to Aristotle, the Attic drumas arose from the recitations of tha leaders of the Dithyrambas. The origin of the Grectan dramus is 6 aid to have been the orgies of shepherds and prasants in their soleminization of the rites of Bacchas, when tha masyuerale, iu which they personatel taums and satyrs hasquerale, iu which they personaten of the masks, they stained their faces with the In phace of the masks, they slained their laces with the lees of whe; and tart of this wild festivity, was added the recita fion of an individnal performer, who entertained the audience hy his own single und ansided exertions. Thespis was the first to slapee a regnlar eatertaioment out of these rude materinls, in which effort he is anid to have been assisted lyy one Sasarinn. The actors were sparated from the nudience, nad nion a cart, or elevated platform made of boaris had upron trentles. The date of this fiest improvement was ahout 440 or 400 years emvertod monolurne and soliloquy into action and diaeonverted ruonologne and soliloquy into action tand dia-
logue. Ife introduced upon the loards more than one actor at the same time, and relieved the dectammtion of the Thespian orator by the mbisical performance of chorns; he also introduced scenery. A theatre, firs or wood, afterwards of stone, accornmodated a number of regular end attentive spectators; and tha principal acturs dressed io porsonal disgmise suitable to the char acters jersmated. They also wore masks puinted to represent the personase whose part they performed The months of these miske were shaped like the end of trumpet, which, though it aided the artor's voice in lulicrus uppearance. The cothurnus, or lonkin, edded to the actor's heisht, the enormous distance betweet the eyes of the anditurs and the actore considerably levsening the epparent absurdities of the mask and unskin. Great tronble and expense were liestowed bon costume. Wheo a Grecian actor persunatod tero or a god, he concented his fite, increased hit height, and wore a dress and mask exactly resembling hee jupular idea of the personage to be portraysd. Tis heatres were of enormons size, and butt in the shape of a horse-shoe. The mutience were placed on seats elevated one above another it gradation. The stage claced ut the flat ond uf the luviluing. The space in the placed ut the flat ond of the building. The space in the centro of the thentre, cnlled in the present day the pit by the chorus. Aschylus having regulated, Sophacles, finripider, and othee dramatists, improvel all amosebent to which the art-loving Greekis becane pastion ately attached. During the puerformance of a play writton by Jhgemon, hews was lirouglit of the total defeat of the firecian army before syracuse. Athong the bul-
ditorn were relations of those who lifd fillen, n.d hardly one spectator hall not, in addition to a patriotic crief, to munsm the loss of a frient or relative. They did not quit the theatre, hut, sprending their mantles helure their faces, ordered the ropresentution to procesb, and, thas veiled, remained till its conchasion. The ntmission to these aucient theatres was ut first one twa olnoli. In their pursumations, the Grecian actors aimed at gravity of noveruent aul declanantory grace. rather thans tho rapidity and vivhetty of passion. They huhl uligh rank in the republic, and popularity carried with it a rich re whpeuse. Thu old Grechan comedy
will he luest drecribul ns the exact opposite and natiwill he best drueribul ns the exnct opjosite and nnti-
thesia to their trugedy; fur as in trugedy, deities, Titann, thanis to their trugedy; for as in trugedy, deities, Titan In cumesly, the while phan of a piece ulten turned upon In cumedy, the while phan of a picee often turned upon
the amo sublimo pursonuges, who were bromght upon the wtage for the nere phapume of ridicule. In fiact, the Orecian convedy way a burlesqua In the most motern somse of the worl, in which lacclus was repremated the anther of this kluf af entertaimaent berst knuw to un, then but the origimatur of the firacian comedy : he hud mary purdecesturn, - Mugnes, Cnitimux, Cratem, Einulis, und others. After ridiruling the olympian the Athenlans lienrtily enjoyma. he male the stage vichich fur utfack on public men, and among other Sucrates and Clpon, a denugogne of groht hafuence, Decresh wero pasaed to protert the citizoty agninat
 capitally for paroulying a litia of Furighles ma me to comvirt it lates wh attak upan the kovernmont. An
 uste. Arfatophanes, w lis found that personality and
invective were no longertolerated, berbed the nrmw of his wit at the aceidents azd alusumdities of domestic life, in which waik of Batire he wha encepsatully ful Juwed by Menander and others. This new mine of satire was ealled by the anciente the New Comedy aud it was robout this time that dramatie representations began to be divided by intervals of erbsation. or hets, the ase of the chorus being piscontianed with the old comedy. it must be remembered that in works furemsing to be it must be remetnal mauners, cunice writers could not is picture of actusi mataners, conmic w riters contd not for representation any temate characters bot thoee of bathers, maid-servants, and courtesans: thus the plut of a juiece often turned ijporthe puselon of a lover for young woushn who wha dot brought upod the stage once during the play Despite these-disadvantages, the bew conedy of the Grueks otteo conveyed a knowl edge of deep truths and sulatle ferling. In closing these briet renarks ppon thie Grerk otage, it must be bientioned that the apastle Panl bas quoted fromi the trionic representation of their own. Their oldest spoken playe were burruiud frum this Osci, the indig spoken plays there borroutd from the Osci, the indig-
eoous inhabitants of Italy, add were called Fithula Atrllanar. The ferformance consisted of satirical couplets, which were dechaimed during the intervals of the gatmes, and tharacters of fabulons antiquity were venally personted. According to livy, Sb7 years before the lirth of Christ, during the rage of the great pteti lence, in order to propitiate the deities. the Romans in troduced a regular drumatic entertainoient. Their playe, hou ever, notwithstanding the assumption of the mask and buskis as a regular profession, were rude in arecian led the way to inuprovement by transplant ing his native stage to Rome. The works of the Ruman tragic authors, with the exception of thuse of Sencer linve not reached our time, thongh, fingularly enough we are compelled to judge of the new echool of Greek comedy through the n.edinm of Latin translations; in deed the Rumans liud two species of coniedy, - the $f$ oilinto in which the scenf and dress were $G$ trecian, and the Togato, in which they were Roman. It is presumed that as Roscins fiallos is mentioned liy Cicerens wearing a mask upon the rtage, in order to conceal an obliqnity of vision, that other neturs of his day play ed with their faces uncovered. The Romans, to guote the words of St. Anghstine, "acconnted the art of stage-playiug inbe deprived of the honor of other citizens, but also be be deprived of the honor of other citizens, but thrust ont of their tribe. This fecling wach doubtless encendered by the fact of the Roman confonuding the dramatic art with the fanues of the circus and amphithentre, io uhich gladiators and slaves performed. Notwithstanding a denumeiatory edict of the pretor, many ncturs rose to great weatth and high esteem in Rome. Roscius was the friend of Piso, Sylla, and Cicero: sod Paris, who was afterwards put to death by Domitian out of jealonsy, exercised an arbitrary atithority over drsmatic authors. Critics formed a code of laws for the guidance and regulation of the puet, of The ancient dramutic art expired with paran nod in its first age Christianity was inimical to the thestre. Any person connected with the dramatic art was not allowed haptism. The convection of tho anwas hat allowed haptism. Ruseconvections the prof ligacy of eome of the putertainments exhibited, of fended the primitive Church. With the extinetion of literature and art, every trace of dranatic compo aition or performatice was for many centuries loat. The modern drama, like the muclent, lind its fom dation in religion, with this difference, that in place of the worshig of Bacchus, viracle-plays nud mysateries were problucid. The firnt speaking sacred dramin Giesin Christu" hy Givliuso Dath, hishop of Sun Leo in 1445 ; mind it wis in Italy, the country in which tho a lasic ; ant expired, that it revived in a difforent sud purer form; but consideralile uncertainty exista on this point, for the Eiench chains the performance of a pastoral entitled "Un Jen" as early as the I Sth century The Chenter Mynterics, the earlieat fiays acted pul itly in England, were performed from 1268 to 1276 The manning attuched to the word "bystery" may lio gleaned frita thon quotation if two of the rerees of the proclamation or prologge to the famons Chester Mys

Luality to place tha amme to atl the row tite,

Rude paridien of nicred hiatory laing Inconviatent with the purity of the Cliristlan relighon, the Mysterien wer micceeded ly the Maralitlon, a sort of performance that bore eunalileratile resemblanice to the oldi Cumedry of tha nnclentn, an thry wire foundwd upon allegoricial suls-
jects, alment aly ajo bore alluston to the evouts of the

DRAM
day, ond sbounded with strong and biting satire. Upon the revival of lettorx Lutin phays were couposed b
the learned in nvowd imitation of the prombctions of the learned in nvownd mitation of the pirmactuns of ancieut Greece and fome; bint the gassic drama whs a sealed book, showed strong putiality to a new sort of representation,
union, or rather compuabd of tragedy aud commed which was called Distory or Historical Drama. These generadly told the exploits of a king from his uasluand to his ile.th, with sorh points of history ns were the
noxt marked and striking of his reign. These dranatic nost marked and striking of his reign. These dranatic
 bingle eubropriated by his gredecessors ; the majority if his histurical plays were, thersfore, altered by him from the plan of old dramatic chronicles. - The Romarnici ravends poems and phoplar fictitions earratures In Spain, the ladd of chivalric romance, Lopez de Vegn ond Calderon, disrecsarding or despising the restrictions of the classic drumn, ibansurated a new school. Their
herves, the exact rever-e of the passionate, scnsmal demionds of the ancient drama, were virthous, belf-sact ficing, bruve, true, and loyal. Action and bustle towk the place of tedions elaboration of sentimeut and thought; the passion of love nas sublimated into high, gencroas, ind romantic feeling; and the introtuction of a clown, who ninhe excemporancous jests botb to actors and to andience, gave grent pleasure to spec-
tators, who were unwilliug that the actors should eatators, who were unwilliug that the actors should en-
tirely ignore their presence, and liked a chorns, though comprehonded in one person, to explaio and criticise the action of a play during its progress in England, the ronantic drama wits welcomed with ardor, In
Italy, the tuste for the ancient and classical school of drama was so routed that romentic dranas, bistories, und tragi-comedies conld not long hohl is place. but were sncceeded by tragedies writtea npoa the chassic
models. - The Ilaliun comedy produced characters that models.- The Italiun comedy produced characters that never varied, some of whom are supposed to bave deScended directly from the Himu of the Fubitian Atedane This ancient origin is clamed for HarleqBin and Pun
chinello, on English Punch, buth of whom are Duflouns chinello, 6 Engrish Poneh, both of whom are buflouns
cowards, wags, and jesters, like the Nonno of the R axans. Pantudone was a Veqetita merchant; Dotore, Bolognese physician; Spaciento, a Neapolitia braggaducio; Putlicenelle, a wag of A pulia; Giengaryolo und Coviello, two clowne of Culabria; Gelsomuro, a Hontan
bean ; Beltrame, a Milamese simpletoa ; Brighella, a Ferrarese pimp; and Arlecchino, a blunderitg sarvaut of Bergamo. Thus each personage, clad is a pecnliar dress, and furnizhed with a pectliar mash, was intended as a characteristic representative of some particulur
Italisa district or town. To further this local persousItalian district or towa. To further this focal persotttion, each actor spoke the dialect of the place he repreof which at least four were introduced into each pliy there were the amorosos or innamorctas - that ie, men and women who played serions parts; and also Sme roldina, Cilombina, Spullettu, and other temales, who acted the servettas and waitigy-maids. These last wore oo masks, ond all spoke Tuscion or Ruman. The pieces pliyed by them were called Commedia delf Arte. Gol-
doni adnpted Harlequin and the rest of bis mimic doni adnpted Harlequin and the rest of bis minic
troop; but, iustead of trasting to the extenupore w of the actors, wrote for them plots and diatogue France has hoa-ted that wheo the classic drama b banashed from every other stage in Eurule, it found it home io Pus, nations, was, during the $16 t h$ and a great part of the
linth century, borrowed from Span. $A$ s the English owe the excellence of their stage to Shak-peare, France is equally indebted to Corneille. Cardinal Bichelien placed hmagelf at the head of five dranatic anthors, all of whom are forgotted, with the exception of Corneille. It was at this period that the classical fetters of the three unitice were imposed upon French dramatic poets. "The unities of activa, time, and place must be olserved." Corneille adds, "Persumut n'en doute." The Freach are not ouly proud of theit preteosions to classicality and their rugard for the have discarded tragi-comedy - that is, such pieces ns compr other of a humorous eorf. each totaniy noconerdins
with the other. Corneill and Racine were, accordin to Sir Walter Scott, the Homer and the Virgat of thic Frenell drama. Evell Voltaire himself was content t imitate these twu great models, although he enteavored to make a Turk talk like a Turk, and a Bavare like a savage, jostead of in the brilliant metaphor and
skilled sentiment of the burkined heroes of his predecessors. Molière, the founder of Freach comedy, fol lowed the pith marked out ly Meoander, and has closely copied sume pieces from the Latio stage. 'Few and it should bo rememhered, when considering his marvellons power, that while the Euglish stare was fostered by a people, the French stage was merely thi was limited to the palace and its immediate surronndings. Schlegel observes, "The object of Freuch contedy is not life, but suci"ty - that perpetual nugotia
tion betwen conflicting vanitles which never ent in a sincere trenty of peact under the arm, and the sword hy the side, etsentidily helong to them; aud the whole of the characterizathot 19 hmited to the folly of the ured and the coquetry of
the wonnen." This comedy of manners rather than if natore was overturned by the "likaru" of Beawnar chatis -a aroduction in which incheat, intrigue, char-

## dy y Braso-

Dysamso-Flectrieal Machise. The basis of ail is a magnet, between the poles of which an armsarmature may be revolved between the poles of the magnet, or the magnet itself revulved aronnd the armature. The former method las considerable practical advantages, 10 either cose, when the machise is in motion, electric curretes are induced in the armature, which, however, change their direction every time the
ide next one pole of the magnet passes from its infinence to that of the opposite pole. If the armature is wound with coils of insmated wire the effect is incressed, awd if this increased current is mate to puas through insulated wire wound aromud the magnet isself, the power of the latter is nuch greater, and this canses
still stronter corrents in the armatme. This mutial etill stronger currents in the armatme. This muthal reinforcement goes on till the point of " naganefic aturation is reached, beyond which it ions iol the speud of the machine. We lave now ia nupreasing ceasion of werfal curreuts, whose direction, however, is reversed as often as a coil of the armature passes is pole of the magnet. To make these available ns continnons corrents, what is known as a commutator is used, and this is in substance merely a prolongation in a suitable form of the ends of the armatare coils, each division of the commutator being insulated from the other8, and the divisions being asnally so arranged as to form a cylinder which revolves with the armature. The portions of the commntator being merely extensions of the coils, and the latf of the armature which onext one pole of the magurt being always pusitive half of the commutator is always convering a pusitive current while the other is always nemative. if at anit able points oppusite each other on the commutator, conductors are applied, we have on one side a continuous positive cnrrebt, and on the other side a coninnons negative current. This is the fundamental dea of all dynamo-electric machines. In practice, very wide variations of constructuob have been tried, including an increased number of maguets and almost very degtce of difference in the shaje of the parts. As understood at present, the dyusmo-electric machine may be defined as a machine whereby energy (motion) is converted into electricity by the aid of the residua lectricity is aused to react on the iron and so leughten its magnetism; aud this increabed magnetism in it turn pives rise to more powerful electrical effecte and so, uotil ite limit is reached, depending partly on the velocity of the motion, partly upon the relative upportionments of the size and quantity of the wire and frob employed in ite construction, and partly on tha resistance throughont the circuit. Although this priociple was fnlly understood, and deecriment by suren Hjorth, of Copenhaved, in his patents, dated Octnher, 1854, and April, 1835, yet the Dame "dy numo" (from dynumis, Gr. force) does uot appear to bave leell used in this connectiou, until Dr. Werner Siemens employed it in a communication to the Berlin Acadeony Jadnary

nemely overwhelmed; as, to be up to the cars in delot.
 (Anat. and Physinl.f A - it exixts in man und mammalia, the car consists of three parts : the extermal ear, the midtle car, or tympanum, and the internal ear, or trumpet-shaped, cartilaginous etructure, called the pin-trumpet-shaped, which collects the soumis, and a tutie which conveys these soonds to the internal ear. (Pig.

A. Fxternal Cartilnge. B, Auditory Passage. C. Tympanamand Eustuchima Tube. D. Stapur, Incus, avd Malleus. E, Semi-
circular Canala. $\mathbf{F}$, Cocblea or Sbell. 896.) The pinna or auricle consists of an uneven piece of yellow cartilage, covered with integnment, and fixed to the markin of the meatus anditorius exturnns.
of an oval forn, with the margin folded, and the Jarger end phaced upward. The romd, rim-ake margin is called the holax, the depression immediately within which being the groove or fossa of the helix. Within the latter is a harge elevation, called the ontihelix, which presents at the upper part a well-marked depression - the fussa of the antinew, named the conche centre of the phinna is a decp ing of the meatus auditorius. In frout of that hollow is a projection of a triangular shape, called the tragus; and un the upposite side of the hollow, rather below the level of the tragus, is unother projection - the antitragus. Inferionly, the piuna is terminated liy a soft, penduluns part, called the inbule. The anditory canal, meatus auditurias externus, or the tube by which sound is conveyod him the piona to the internal ear, or tympanmm, is aboit 1, inchesin length, and is formed partly by bone, and party by cartilage and mombrane. Its direction is chbiqnely forwards and inwaris, and is sonewhat bent thwre than at cither extremity. In shape it ia rather flatthars than at either extremity. In slape it ia rather flat bent part. The cartilasinoty portion is about half an inch in length, and is formed by the cartilage of the concha ninl tragu* heing projected inward to the ciremmference of the tulitury paskage, to which it is firmly attached. The nsseons purtion is atont three quarters of an incla in length. and in narrower than the cartilnginous part. Its muter extremity is dilated, and rough in the greater
 than the of onter, and in slapual, min that tho anterior wall jute ont for the insertion of the memblana fympani. The skin lining tho matitory canal is very thin, and is contiunsel over tha memtrate of the tympantun in the form of a thin fultiven, forming is sater covering Aronnt the

 malleus, or
mallet, consints of a head, neck, haadle, nud two processes, a long and a short. The incus, so called from its resemblance to an anvil, but which rather resembles a the uther, and bent to abe side, cansists of a borly and two processes. The stapes, or stirmp, consists of a bead, neck, two branches, and a base. These small bothes are coonected together, nad with the tympanum, by ligaments, and moved by small muscles. The hanulle of the mallews is attucbed externally to the membrana tympani; its head articulates with the body of the
incus. The shorter process of the incus is received into ancus. The shorter prueess of the incus is received into long process carving downwards and ending in a rons, thed connex point, where it articulates with thi head of the stapes. This last has a horizuntal position, with tha crura or branches directed forwards and backworis: and its base is fixed over the fousstra multis of the internal wall of the tympanum. This is at reniform opening leading from the tympanam into the veotilule, the opuning being closed by the delicate lining membrane common to both cavities. The inner and fonmsmental portion of the organ of hearing is called the leblyrinth, and consints of three parts-the vestibule, the semicircular canals, and the cochlen. It consists of the petrous lathe, comonnication externally with the cavity of the tympamam and intermally with the muatus cavity of the tympanmm, and intermally with the meatus
nuditorins iatermus, which contains the unditory nurve Within the ossmons luhyrinth is contatimed the mentbratuns laliyrinth, upon which the ramifications of the anditory nerve are distributed. The vestilnte is the common central cavity of the ossoons lalyriath, ant is placed behind the cochlen, hat in front of the aemicircular catnals. It is suniewhat wal in form, und measures ahout 1-5th inch in different directions, hut in marrowest from withont inwarte. In its nuterior wall is a largo oval openiug lending to the cochlea; and in ita posterior and superior walls are five openings, hy which
it communicates with the ea-micircular camale. Thuno are thrie bony carals sitmited above and lrohind the vestibule. They ure of unequal length, and memare
 dilated just hefore opening into the vestilunto, the ons end in rach being more dilnted! than the other, and called the nmpulta. They descrile the greater part of acircles, and all open at both ends into the vestihnle, the ends of two of them, however, conlesering. From a difference in the direction thken hy these canals, they have been named the superimer and justerion vertical, and the horizuntal. The cochlom, sul named from its rememblanco to a snail's shesll, is conical in form, and placed cimont lumizentany in font of the vestionio.
 canal wituling spiratly ronend it for two tures and is lusle from the bame to tho nowx, und of a delievite Inmina, contrinced within tho catal, which follown itu wiandinge, нin) sultivites it into (wu pansagen. When masured alonge the onter side, the eatrat is nonut Iog men long, and lia diameter at the beginning alrust l-luth inch,
 uther ent. The whole intuer eurfate of tho labyrinth, Inc-luding the nemieircular catula and the poxsages of the cochlom, is limel with in thin fibronn membirane the the inner is coverod with usingle liyer uf eplesolium like that on surome membiranes, wid sucretes a thita

 the mumbranome labyrinth. Thin lust is a membennout

form, containing a fluil called the endolymph. That part of the membranous labyrinth contanaed in the vestibule consists of two rounded portions, which, though
closely conuected together, appear to be distinct sacs, the larger of the two, the utricle or common limus, being situated at the posterior und upper purt of the veatibule; the other, the saccule, is smaller and rounder, and is situated fa the lower und fore part of the vesti-
bule. Suall calcareous masses, consistiag of minute bule. Sanall calcareots masscs, consistiag of mimute
rounded and elongated grains of ciarbonate of lime, are situated in the inaur part of the wall of the utricle and situated in the inaur part of the haditory nerve, which is distributud over the different parts of the labyriuth, entera liy the mentus anditorius interans, and divides into two branches, viz.. an aaterior for tho cucblea, and a pusterior for the membranous labyrinth. The cochlear brauch divides at the base of the modiolus or axis into aqnerous twigs. that enter the apertures in that boity, whence they are directed outwards. The vestibular branch divules into three branches, which proceed to the membranons laby rinth, und ramify theutetves on the walls of the sacs some of the fine flaments passing through the otolith or catcareous mass, and "thiers outside of it.- The sense of heuring is, strictly speaking, only a retiaement of the versant arise wholly from peculiar uudulations, pro pagated in abedience to ordinary laws. it the meduta in which the animal lives, and impinging more or less immediately on a seasitive part. The trampet-like pinaa or auricle of the external ear serves to collect the sound, which is then conveyed, by means of tho meatos anditorius externus, to the membrana tyropani. Thas
is thrown into vibration, which is communicated to the is thruwn into vibration, which is commanacaled to the
malleus, and is carried by the incus and stapes to the alemlrane of the fenestr.a ovialis. Frow this last the membrannus labyriath, taken up by the fine flaments of the auditory nerve, and conveved to the brain. The use of the small calcarcous miasta in the gacs is t strengthen the sonorous undulations, and to commumi cate to the nerves stronger impulses than the lymph alone could impart. The range of heariog differs very much in differeat individuals. Sounds noperceived by some are readily heard by others. The ordinary range of human bearing, comprised betwoen the lowest notes of the organ and the hirhest known sound enitted by iosects, includes, according to Wollaston, nore than nine octaves, all of which are distioctly perceptible by most ears. - Soe Deafiess.

wires at a small distaoce from each other, end their positions carefully ohserved by means of a telescope. Irame, aro bronglt near to them. Observations sre then male to see how much these smaller balls attracted out of their places by the large ones. By another movement of the turning framse, the large balls can be lirought to the position H K. The smal balls are always put ioto a state of vibration by the attraction of the larger ones; then by owserviog the extreme distances to whinch they $w$ wing both
ways, ad taking the middle place between those extreme distances, we find the place at which the attraction of the large balls woold bold them ready Thea, knowiog the size of the large balls and their distances from the small balls in the experiment, sud know-
ing ajso the size of the $\boldsymbol{E}$., and the distance of the seall ing aiso the size of the $\boldsymbol{E}$. and the distance of the seall
biths from the centre of the $\boldsymbol{E}$., we can calculate what bathe from the ceatre of the $\boldsymbol{E}$., we can calculate what
would be the pruportion of the attraction of the larg would be the pruportion of the attraction of the large
balls on the Brall balls to the attraction of the $E$. on balls on the small Lalls to the attractron of the $E$. on
the amall balls (that is, the weight of the sanall halls). if the leadon balls had the sanse density as the mean den Gity of the $E$. It was found that this would produce
emaller aftraction than that computed from the ober vations. Consionuently, the mean density of the $\boldsymbol{E}$. is less than the density of lead in the same proportion and thus the mean density of the $E$ is found to be as
abovestated - $-6 \cdot 6$. The $E$ moves in its orbit from $W$ above stated $-3 \cdot 67$. The $E$ moves in its orbit from $\$ 1$
to E. ; it performa its agqual revolution in abeut $360^{1}$ days, and its revolution on its own axis io 23 hours, 5 minuter, and 4 seconds. The orbit of the $E$. is no ellips of small eccentricity, having the sun in one of its foci.
The earth's sxis bas an inclination to the plane of it. The earth's $8 \times 18$ has an inclination to the plate of its
orbit of $231^{\circ}$; from this arise the phemoment of the seasans, and the variations in the length of day and night The temperature of the surface of the E. varics at diffir ent times from diffrent causes. (Sce Climate, Meteoreasons, gencrally supposed to possurs a high tempera-ture:-1. The firm of the earth, wearly spherical, and fluttened at the poles of rotation, tozether with the reg.

race have been destroyed by these conrulatons. When an $E$. nceurs, observers state that the shock bas nt first a distinct vertical direction, coming from below upwards, gradually more horizontal, till it ceases. This motion is evidently caused by an earth-wave, or andulation of the solid crust of the earth. These waves must move rery rapidly, ofted not lasting at any point more than a secoud of time. When $E$. occur near the ehore, tha raising of the earth of course affects the eea, and immense tidal waves sweep over the laud, often at a great distance from the shore, with irresietible fury. The $\boldsymbol{E}$. which occurred io 1868 at the Sandwich Islands end along the west coast of South America, ranks among tho bost violent and destructive of which history has made record. In Peru, from Callso to Iguique, the whole coast Entira cities were destroyed. Immense tidal wares swept is upon the const dashing muny vessels in pieces, atad destroying much property and many lives, It has been estimated that 30,000 lives were lost in Sonth America by this $E$, and property destroyed to the amount of $\$ 300,000,000$. In Octolier of the same year s violent ebock was experienced at San Francisco, Cal. May, 18i7, an E. occurred on the coasts of Peru and Bolivia nesrly as destructive an that of 1868. Ilquique. Cobija, und sereral other towns were almost destroyed, and eeveral hundred lives lest. $E$. .s operate to raike the Isnd nasses, and thue oppose the destructive tendency of the agueous agencies, which incessantly labor

Last India Company, a celebrated jeint-stock assuciation, otiginally estallished to crrry on the trade between Great Britain and the East Indies, or rather with the countries to the eastward of the Cape of Good Hope. It was constituted by royal charter in J 600 , and continued, botwithstanding repeated eforts to open the trade, to enjoy the exclusive privileges conceded till 1688. At that period, the power of the crown to restrain the freedom of trade without the sanction of Parliament of Parliament in its favor: lut after a rariety of negoof Pariament in its favor; but after a Fariety of nego-
tintions, which it is nonecessary to specify, the two cur porations were joined in 1702 under the name of The porations were joined in 1702, under the name of The anitad Crapany of Merchonts trading to the East Indies day. In 1708 the United Company was secnred pry Parliament in the exclusive privilege of tradiog to all places eastward of the Cape of Good Hope to the straits of Magellan; and this privilege, with some modifications, was confirmel and prolonged by successive Acts of larliament down to 1514. Ry the Act 53 Geo. 111. c. 1:3 passed 1813, the East India Company's charter was renewed for twenty years; but it then received some imwith the whole of the Com whe permitted to all British nercbants; the monopnly of the trade between Encland and China being, however retained in the hands of the Fast India Compans. Thees concessione paved the way for the Act of 1833 , by which though the Company's charter was contimned till 1854 , not enly was the monopoly of the China trade abolished, but an end wholly put to the Company's nriginal claracter ne a conmercial association. But it is not is conmercial association somuch as a great territorial power, that the East India Company kecame distingnished. The first eftablishments of the Euglish in Tudia, as of other European nations, arose out of the Blliged necessity of prorising armed factories or Rtronghonls, Where insafety for the purpose uf carryine on their intercourse with the natives; bnt the factories spepdily degenerated into fortifications, and the garrisons into armirs, For a while, the power of the Engli-h and French was pretty nearly halanced in India; but the talents and victuries of Lord Clive gave to the British a decided superiority over every other competitor, foreigo or native, and extended their sway over some of the largest and finest portions of the Magnl empire. The immense power wiehled by the Finst India Comjany, lessening aod even overshadowing the prerogative of the Cruwn, obliged tho latter to eventually rescind the Complanys clanter (ini otpite of a strentuons resishmer in 180s, wind to tramsior to the Imperial govt, the sole political control of the nf-
fuirs of Imilia. In thit year, ncenolingly, liy Act of Purfiirs of hime ont, the entire power hithurto rested in the Company lecame transfrred to the home govt., which lum since nssumed tho whole and andigputed rule of that vist country. The bat Imin Company kill exists, but for littleother purpore than to receivo and pay the dividends of those individuls of the popular community who invested theic monry in its stock.

Eeho. (elo.) (Myth.) A danghter of the Air and Tellas, who chedly resided in the viciaity of the Cephisus. She was unce one of Juno's attendats, but her lugatcity displeased Jupiter, when she was deprived of the puwer of speech by Juns, and enly permitted to auswer the questionsed by Juno, she pined wway throneh love of punished by Juno, she pined wWay through love of
and repentad to the ear sinnd is prodnced by wave
or puises of the air. When these waves come in contret with a chff or wall, or other opposing surface, they tre
reflected like light or heat. When the sound is oo re Hected as to come back to the observer s par, at is callel an echo. In order that the echo may be heard at the plave where the sound oniginated, it is Decessary that the reflecting surface should be at right angles
line drawn to the point where the olserver statnds. An
oblique wall throws off the echo so that it can be heari oblique wall throws of the echoso thers, but uot by the orginator of the sumbi. The by others, but perfect echoes come from surfaces that are either evan, or chrvel so as to te in the liorm of a comatse mirror. This, bowever, is not necessitry; for a very mirror.
distinet echo is of en returned from the edge of a woml. Sount travels at the sate or in it is necessary, in order to obtain un echo, to be at leust 62 feet from the reflerting surface, and l-9th of a srcond mist be allowed torelape in orater to dastingnish the sunnl from the echo, the orjerinal sound, thas makneg both indistanct. In many churches anut phblic halls, where the principhes of acoustics havo not speaker's voice. The di-tribution of sumblin public hailings, so that the echnes may asist in strengtheming the original sound, is a subject of great importathee. An ingomous elergyan of emmortorg which hat the effect of stung him while he prenched, bowever iamartially the subject of his dis: course was imparted to his congreg.tion. Whan severat objects reflect sonnd, the mumber of echoes is maitiplieh, the sounds growing weaker and weaker until they die away. In order to produce many sounds, tion reflecting plane mast be at a considernble distance. Woudstock there is an echo that repeats about twenty
syllables, aod the Swits muntanneers sing their sonss byllables, and the Swiss minantancers sing their roniss, that the echo forms an arcorupaniment to the air. The number of syllables that an echo will repeat tepends, of conrse, on the distance of the reflectins snrface Irom the origin of the sound. At the tomb of M-tellit, in the
 ing $21 / 2$ seconds to utter it. The echoes of Killaruey, in Ireland, are celebratted, nod atso those of sume of the
$W$ elah lakes, more especially that of 1, iyn I dwal. Near Milan there is un especially that of hify I dwal. No pistol sixty times. Dr. Chiss. $G$ Page, in the Aus. Jumr. of Science, 1839 , mentions a locality in Fanitux C0, ,al. where three reflectious are givel, aud 13 syliables can
be distinguished. The same article mentions an ech observed between two barns at Belvidere, Alleghany uo times. which reppais urord sowad procepdion froul of the foci, and impinging agivist the curve is reflectiod th) the other forms; whence two perrons placed it the two fuci of an elifitical chamber may converse with each other its a whisper, and their voices not be hearit by those who are in the otler parts of the room.

Educable, $a$. Capable of being educated educated. Lineate, $v, a$. [Lat. cdüco, educatus $-c \times$, nad den to lead, bring, or conduct.] To bring un, as a child; to EAns'a'tion, $n$. [Fr. Éluration, from Lit, eden, I lead
 creature capable of $L$. The lower animals require, at
most, only murishmat and protection to enable them to reach their proper condition, and to perform ail the ers and faculties indebniculy perfectible, ats which ne quire to be trained anil directed lay others; otherwise they may lee wireless, if not absolutely injurious. In this way Providence has wisely provided for the progress of are hot a whit more advanced than what they were originally created, man has lien gradually progressing towarit a higher anal more perfect senate of development. and that exactly in proportion us the true principles of his nature were mulerstord and acted upon. Each gen erathon profits by the learning sud experience of that edge to its successors. $E$, in its must extended sernav. thew, has to do with the progress of the human race to. gradual note perfect state of development from the curliest dawn of hark it to the present tame, observing the furious circumstance that may have tended to promote or retard its progress, and sicks to gather from thu, white, instruction for the 1, resent. or lessons for the future, In a more limited sense, $\boldsymbol{E}^{2}$ regards man as un individual destined for a
future and higher state of existence, for which his enfuture and higher state of existence, for which his en-
tire life in this world is merely a preparatory training. It ire life in this world is merely a preparatory framing, In everything which he experiences, frown the cradle to the grave. In a still narrower sense, the term is applied the grave. In a still narrower sense, the term is applied
to the training which one receives in childhood and early youth, in order to fit him for a proper discharge of his important period of life. The mind of the inalividual is then most susceptible of impressions, which are at the same time the must lasting; and, generally speaking, the training which he then receives marks his character through life. While we shall bo obliged. in the present article, to confine our attention to the last of these, as embracing the most important period of life, nd re-
girds $E$., yet it is only by keeping in view that our bards E., yet it is only by keeping in view that our higher state of existence, and that all our training higher state of existrmoe, and that all our tramming clear and correct notions respecting it. E., then, we would define tote the full and harnooinns development of all the powers and capacities of man $-f$ full, that is, each to the highest point of which it is capable: and harmonious, each in complete unison with all the rest.
In other words, it is the bringing of lis entire mature into the highest state of perfection of which it is etas eptible; for, in the words of Milton, the end of $E$ is "to repair the ruins of our first parents, - to restore
harmony and beauty, and power to that system which foul $E$ with intinction found $E$. with instruction, and much misunderstand without some instruction, but there may be a great without some instruction, bit there may be a great cate man is ut he who linows most, but he that can do most. Bacon has well said that men are apt to set too high a value upon their arquirements, sol to underrate their faculties. It is impossible, from the nature of the present work, that we can traverse the vast field that
the abject of $E$ opens up to ne, or notice the numerous the subject of $E$, opens up to ne, or notice the numerous
important quosinns that are connected with it: and perhaps wo shall best employ our space lay noticing perhaps wo shall best employ our space li noticing
some of the more important points which are as yet hat little understand or anted upon. In order to educate a human being. it is first of all necessary to know some thing of the nature of that being; for $E$. can be right or true only as it is hissed upon a knowledge of that nattire, and of the laws to which it is subject. Until and acted up we have little hope for any great progress in $E$. Man is not only subject to certain laws, re-
gulating his growth, wad determining his condition, gulating his growth, and determining his condition, but
he is also pussessal) of a variety of faculties differing he is also jussessal of a variety of faculties differing greatly in their nature- and character, having different periods of development, athd requiring deferent modes of treatment. It is only by extending we can expect to arrive at a true system of $E$., which has for its object their full and harmonious development. The true chacator carefully observes the workings of nature, and pursues the course that she indicates, aiding her in her operations, and, it may be, directly opposing or thwarting her, for he knows that she ever worketh wisely and well. Man, then, is pos-
ecssed of a twofold oature-a spiritual bod a material;

the one partaking of the nature of spirit, the other sub ct to the laws of muter. It in unnecessary for eur of cither spirit or matter mart and li itself. In man nd it is o only mure the two jus-paralily connected, but there is every revision to believe them to be inseparably prosit
 a portion of the tisanes of that part, au, in like manner, very thought that phased through the mind causes de Thus, every thought of the mind martel of of the me thus, every habit the mind partakes of the ma ho body of therpiritial at well as the material. This of importance to lowe in ruins. fur we constantly hear people speaking of mental ants natal physical acts, as if the two wore distinct nut separate, and nut intimutely connected the one with the other. In fact, the whole tendency of science in the present hay is tulirenk pen into pieces, viewhy him as distinct and soma mite parts, intend of one beahtimi and united whole We believe that nut only are spirit and matter inannawhere limited lis than, latter: that the loomed is everythe prison-hause of the soul tut only is there every
 rally regariled as the nature of attrit, hut wo cana otherwise neremat for the puri gwissin growth of the binal with the body - its lecblenees is childhome, It trough in manhood, nad its denny in old the, one sitiont moll, says hippocrates, is nays the kine fliroughont the whole conses of one lite - in youth and in age, when we are children and grown men; but the bod. . . a to hut is constantly changing. It is only by hearing in body the spirit and the depurblume of the later upon the former for its manifestations, the we late are upon explain panay of the mental phenomena; aral hence, too, wo may, in many case, obtain a clue how to proceed in $E$ : We thus conte to know that the body and spirit in man are not two distinct and opposing elements, the one being improved and strengthened 5 the other is weakened and depressed. The two are in insolubly united - the spirit giving life to the botfly the body giving direction and form to the mint. Anu bot only so, but our physical mature plays a much more buportaned or acted upon in al economy than is kemernily rain of the mind is apart of our physical constitutive
 exercise to develop it, and a due supply of arterind hood to maintain it ina state of health. 'To the educator too it is important to know that lie is not, in the perform ane of his duties, dealing with incomprehensible spirit moving in another sphere and the laws of whose offer cations it is impossible for him to divine; but that the spirit is strictly limited, and sulpert to the laws of mat ter; that it is in obedinnes to these laws that its open anions are carried oh, and that. however myst-riohe suthe of causes which further here a valuable provision fir the radial inGrover here a vacuole provision for the gradual intmental ae well as physical qualities are transmitted from parents to children. however explicable the laws by which it is regulated may be at present, or bow many apparent excoptiman may occur. In our view, the pen rial fact is experamed by the physical character of the minds organ, that, hs the outward physical form ranomitted from jurents to children, our is the physical character of the brain; am fir nan who has fought the good fight against his evil affections and lusts, and has $k$ pt the faith with his latter nature, not only enjoy e of knowing that he may thereby he transmitting to hi posterity the most valunlue of all isheritume to "1 order" says Sir is. Brodie "to mate the most of the in tellectual powers, the animal system should he maintanned in a state ns nearly as passible approaching perlect health." "The state of mind, whether as regard e the moral or the int-Hectual, i-, to a very great extent subjected to the influence of physical cunse-8." But mot only does this now the primary importance of physical health in F., but it lade us to look for the like laws governing the mind as we know govern the bodily. The develop a muscle we exercise it: if we. We we wont to faculty, wis must in like manner porcine it improve faculty, we mast, in like manner, exorcise it. In the one case, as in the other, the exercise must pee proper ron of exercise should be succeeded by a time of rest. It is now the generally received opinion anuria philosophera and men of science, that different faculties of the mind have different portions of the brain for their or gins: and hence it in that the mime, when tired of one alleges, eam turn with fresh vigour to another, in the same why as one tied withy walking may sit down to some
 protracted exercise to another: more particularly from protracted exercise to another; more particularly from The exercise of any part of the body causes an increased flow of nutritious blood to that part ; and this continue for monies time after the exercise has censed, to supply the waste that has taken place: and hence to witholraw the blood at once in another direction by "x-rcising other orcure, and deprives the wasted part of its due nourishment.

EDUC
EDUC
EDWA

But while the two elements of man's nature are con ceroed iu every act, some partake more ot the one and
others of the other; and hence we have the coumon others of the "ther; and hence we have the common
division of them ioto physical and mental acts, the division of them ioto physical and mental acts, the
former comprising the outward acts of the body, the latformer comprising the outward acts of the body, the lathave a twofold division of $E$., into plysical and mental. Of physical $E$, whish desle with the proper development of the physical powers, it will not he necessary tue suy much. It is, indeed, a suliject of the necesimplortance, and entitled to much more attention than it has yet received, a. it is not only upon it that the beath of the body mainly depends, but it 18 by it thett the bouly
is thate the really, willing, and obedient survant of the is made the realy, willing, and obedient survant of the
mind. Its olyectouglit to be to impart strongth, dignity mind. Its oljectonglit to be to impart strength, dignity of correct hathts formed io early life, whether they may be uscful accomplishments, a graceni deportment, cor-
rectness of prononciation, or any kiod of manmal doxterity, contimues to be felt throurghont the cuarse of one s terity, continues to be felt throurbont the cuturse of one
life. Mental $E$. has to do with the mind of man, and ought to be based upon a knowledge of that portion of
his onture. The mint is that which feels, thinks, and acts, or is characterized by feeling, thouzht, ind action The first of these comprives not ouly those feelongs wat impressions that are communicated through the senses bet also the emotims and moral leelings, and generally all such as arose from states of the mind itself. In
thought, the mind turns itscli in wpon those leelings thuyght, the mind turns itself in npon those letimgs
reasons of them, juiges of them, arranges and conpare then. In the last of these we have theactive priacipies of the mind. or thase that propel it intosaction; as the de eiresamd the will. Thereare two kinds of actions; either ing the thuaghts, calling up ideas, and forming concerp-
 dent faculties, and not as one entire and united whale. Feeling, thonght, and action are unly different manifestations of the saman active primeiple, and ought properly
to go tugether. One of the great errors of the prisent to go tugether. One of the great errors of the present
system is, that they are kept too much npart. Feeliuge system is, that they are kept too minch npart. Fecliugs
are not so caltivated as to improve thought ; and thought too frequently terminutes in itself, without going ont into netion. The proper mlyject of all thonght aud feelIng is netion, which is the gre.t end of hife. One great
means of imparting decision of character to children is to teach them anguestioningly inal unhesitatingly to obey. Further, we believe that if people were true to
their feelings, they would gearatily be found to act much more wisely on the spur of the moment than aiter mitture consileration; not from acting blindy, but from fhllowing a trucr gamde than reason. But to explain this
will leal to unother important guestion conuected will whe phe日omat of mimpratituestion conuected wilh the phenomina of misd, - that is, to what extent are
we conscious of the operations of tho mind? This is a conssion that has not hitherto received manch attention in this conntry. The dact rine of unconstions perception, or latent thonght, orixinated with L Libuit\%, and from him has passed into the principal phalomphvarions mames; as, latent or nltrateconscious thourht, mutonscions cerelmation, reflex wetion of the brain,
\&e. Thin ductrine may lof illustrated in many ways, A man, after pazaling wver a dificult probjem for a long time, and, unable to solve it, turns his attention to momathing erse, and after a time, on rethrning to it
ugain, he finds it all arranged ant plain betors him, shain, he binds it all arranged and plain betorns him, of it in the infurval. Certain conditions of the atmosphere produce ligintnees or depressiot of spirits, hy means of inupressions of which wo are insensilhle ; and the unphavant drewous which resalt from indigestion are to Leyond eonscion+ne-s there exist in tho mind syotems of knowlothe of which we are wholly uncouscions in orlinary atatem, and which are only revealed on exir.ior-

 and intuitions of onr matury-those inmate principles
of mornlity rud beanty which reeon to 12 an incunumis henoible, knided and dirceted, it may be, by feelinge of pleasurv and pain. It meems as if the mind might lie
 liker a light at the manth, prrmits nos ouly to lowk
little way.
 Rat bure are carried on thuse woblerfal mental pre cerswe which are oaly known to wh ly their rosalts. The

 that the truly ntromg mand, visw it as lutellowt, no maratNain min wiy

mcience," Policemen are necessary where rogues exist but were society perfect, there would be no ringees, nad no neer for policemee. Further, not only are the highest
acts of the mind instinctive, but the tendency of all acts of the mind instinctive, bot the tendency of all
mental acts is to become so by practice. Acts of which mentul acts is to become so ly practice. Acts of which
the mind wis at first painfilly conscious, become gradually less 80 , until at lenyth they maty be performed quite mk moncou-ly. Whength they may be performed yone the principle that there is in humah natere ounethin abouk and beyond rearen, their lalors wourd be croulag with nore simetes, - more expecially as it is during the carliest period of life that our inztincts are most active and most surceptible of iuprovement. Everythiag ought then to be done to streogtbeo and fructify ite primary instinets of the chind. If we observe oatbre, we shall
fiud that early childhood is preesminently the time for fiud that early clildahood is preeminently the time for imbiting knowledge. Who can estinate the amount of years of its life, without effort, without instruction, years of its life, without effort, without instruction,
without anything but the spontaneons worknus of its own mind? This knowledke, however, is entirely objective. being wequired from nature and life around it. This, then, is the period for perceptive teaching - for oturing the nind with objective knowledge. But during this time the child is not content with being merely the recipient of knowledre; true to its instincts, it soon Lecins to reproduce what it has nequired,- to imitate whiter of seizing vivid ideas of thinus of femp. The associating, anil connecting them with the appropriate word or signe, is now in the hishest state of inteasity. Nature, therefore, hows that in education our prinepal for the growth and erpanson of the powers of inwent representation,-that je, tor strengthenine the memory training and regulatiog the innupination, giving full play to the laws of association, and producing the capacity of expressing ideas in clear, luminons, correct, and copions ucquird with great fuculity at this time of life; but, if neglected now, so difficult ions the process of their education afterwaris secome that it is a thousiad chances of one whether they will ever beacqured to any degree
of perfection at all. As the reasoning facultics becona more advanced and mature, these powers \&radally degeterate. It is, therefore, of the greatest importince this period of liff, hut that nothing should be daring to abridge it by prematurely dercloping the reasoaing far ulties. Uufortunately, however, this is the tendency of much of the teaching of the present day. The teacher, not content with receiving a correct answer to a question most also hatve the reasm why it is so. The less the child has to do with giving or receiving reasons at thit
time the better. Direct tewhiny is the hest. and rule time the better. Direct teaching is the hest; and rules. or the applucation or them, shonld be as little resorted of are possinge. Still nure reprehensible is the practice wrong st the sume time; or, aftor receiving a correc answer, asking if he is sure it is not sompething else. I not ouly temis to loosen its bold in the child's mind but to make him dubtul of his knowledge. As in morals the greatest injury you can doun inmocent child tursuspect him, so in teaching yout camot don greate dge. In knuwledge, care ougtht to be taken to follow only the natural order. If ynestiuned un the sultiect of his read me, the quextions should follow the order in which it or, as is bometines donn, by prociesling from the lesson the be giming. This is of more importiance than it to at tirst secm; for there are certuin laws of the mind commonly known as the laws of assonciation, seceraling to which thimgs are stored up in the nemory and $r$ e prombecl. One of these is that thimps are reprontuced prombeca. One of these is that things are reprondnced received; and an labitu, depertore from this oriker is deatructive of one of the finest madmest impurtaut hive if thind. It is in this way that one comses to nequire the style nad moders of themsht of naother, the thoushts himing naturnly in the sume why, the ifeas sumgestins orner in the like order. In every pricers of thonght

 fusion, - thaukits sprimging up that are not directly wanted, and the mind becomime erowated with dirrele vant matters. An in my mechumeaboperation the work grese on lwest whon the materiala are bromght to lathd. as and in the ordi-r thint they are requircd, so in mental apheratione the mind acts heet when the thonchts nam words are lerought heflure it caately in the order the thery ur meroles), when it in kiven them at the poper time what thay shath nas: nad if people womld kive nure heredt the inatiative partion of their mature. they

be so far from needing any logic to direct ns in onr reasoning, that we shall have but littie need or use even of reason itself. But reason is given to us, and is necersary for us bere, and therefore repuires cultivation. Tbough bot the highest fuculty of onr nature, it is the most practicn, and that which hus the closest bearing opon the orerpotions and duties of life. This faculty deals
with the general and abstract, separates our knowledge into definite parte, urranges, separates our knowledge into definte parts, urranges, classifing, and embodies it athd draws conclusions from it into formal propositions, As the mental powers become sumplosition to auother. the main portion of our intellectul $b$, share, thea rected to the regulation and development of this faculty by necans of the higher hranches of atudy - lugic mathe matics, science, and philosophy. We have said little of the means of $E$ - of what is to he taught and the order in which it ought to be communicatad; lut this is the less necessary, as those who shall have intelligently followcd us in the nbove remarks will be able io some measure to judge for themselves on these poiots. The great thing in each case is to follow nature, pursuing the conrse that she points out: and, as a general rale, to be fillowed in the $E$. of the individul orer that ought The olject of $E$ is the full the individual mombers of it. of all our faculties, the bringiog onr entire nature physical, moral, and intellectual, into the highest state, of perfection of which it is capable. - For the edoca tional systems and statisties of the $\mathbf{U}$.  is the resort of distinct trities of Arabs, whe confline themselves to particmar localitiex; they consist of the
Sanzy, occupying the country to the east of Uenisou-f, Alumi, hud Henilusel, S. of the Manzy and the Alsabdie Aralh, whon are deitteresh aver the N. purt of the descert, What of Eyynt presents a scepe so formidable to tratellers, that few hove visited the Oases by whech it is here not there intursperseld. Thery, no dnult. owe their origin
to the aprines with which they thound, the decay of the to the ariugs with which they abound, the decay of the
vegetation thence ariming laving pronned the boil by vegetation thace ariang having proinced the soil by
which they are now covered. That lertitity hat been When they are now covered. Thar lerthity hat been
duarvedly celolirated; lut the flowing enloginms of truellers on their surpuwang leanty are probahly, in a trucellors on thir surpuwing heanty are probahly, in a
great meature, til he ascribed to the striking contrast they prownt to the murronuling desurts of arif, burning remarkibly dry. Whentit few dropes of rain fill, they are vewned by the imhalitants almust as a mirncle. Io lawer Basylit, the tatest absurvations give 13 daye of cain in a year. Thunher anillightning are nearly egually

 threatran, when long continuen), winunt the extinetion of nnimal lif.: fartumately. however, it meldom lasts above three daym. 'flee hest of the climate, combined with the filthy labits of the prople, is consintered faverable to the ravazee of the phague, which is supposed to inalm peendiar to $E$. - Znil. The wildanimalate tigers,

 bite of whather the thowe who here the necret ef

are occopied with cotton; 100,000 with flax, indigo, sugar, dates, bemp, \&c., and the rest with millet, navize, wheat, and rice The effarts of the present govern
ment have beep principally direeted to the culture of cottoo. so that the crops of wheat have greatly fallen off, and Alexandria has almost ceased to be a port for shipment of this kisd of groin. The cotton of $\underset{E}{ }$. is mixed stapled, of good quality, aud the soil is well suited to ito grawth. By far the largest amonnt of this product is exported to Great lhitaia. In 1861, the ex portation amounted to $40,892,096 \mathrm{lls}$.: it ruse to $59,012.464$ lhis. is $1862 ;$ to $93,552,36 \times 16 s$ in 1843 ; to $125,493,648$ $\mathrm{H} / \mathrm{s}$, in 1864 ; and to $175, \$ 38,144 \mathrm{lbs}$. in 1065 . The ship-
nuente, however, declined from 1 Neti, owing to the restorution of peace in this cuuntry, and averayes now ratioo of peace in this country, and averages now
$120,000,060$ lbs. - Conmerce. No conntry cau be better situated for commerce thao Eryjit. She ferms the linh that connects the Eastern and Western worlis: and it is to her admirable situation in this respect, and to the comanerce of which she in consequence becane the cen ire, that hur wrient wealth and civilization are mainly to be ascribed. The ruin of commerce, in modera times ought to le traced to the suljection of the country tu tie lawless and arbitrary dominon of the Manehokes who louded all articles passiog throngh $E$, with oppres Itulia by the Cape of Goui II upe, liut a new era has Itura by the Cape of door interouse with the East has already in part reverted to ita old channel, and the comparatively recent opuning of the fimous canal which now connects the Red Sea and the Mediterranena, may restore $\boldsymbol{E}$. to ito nuci-nt state of prosperity and civilization. See
Alexandala, ant Stex (CANAL of).-Gort. and Laws. $E$, whose history cononeoces with the history of civilized man and organized governatent, which gave laws
to the old world and art to the Greeks, after being for to the old world and art to the Greeks, after being for
masay centuries suljected to foreign oasters, became, at many centuries suljected tof foreign onasters, became, at
length, at pros, of the Ottoman empire. Under the Turkish sway it was long her fate to suffer that worst kind of despotism resulting from the delepation of arbitrary power by a careless tyrannical master to a scareely responsible bervant. The beld, innovating spirit of the first independent rnler of $\boldsymbol{E}$., the celebrated sehemet
Ali, has, however, introdnced several reforms into the administrative constitutiun of the government, which have been upon the whole lieneficial. The government of Egypt, as at present organized, consists of - let, an hereditary linedive (the Arabic equivalent of King, subject to an annual tribute to the sultat, of $\$ 3,426,340$ ): 2i, his deputy, ealted kikhya; 31, seven conocils of state; 4th, rovernors (nazir) appointed to cach province
The country is divided into 3 kreat provinces, viz: Saud or Epper $E$ : Vostani, or Mudlle $E$ : and Bahari, or Lower $E$. Those prov, are agatin divided into 7 intendancirs, aul subdivided, alter the Fremh system, into dep, and arrondissentents. In other respects, the succesbors of Sthemet Ali huse tried to imitate the forms of govermuant of loperial Frace. The Khedive, or l'asha, was, with some few exceptions, proprietor of all the land of $E$; and lie, io fact, the mly considerable agricultarist, manuficturer, and trider in the country. Hn specilied the employment in which the bulk of the population sbould engage, the crups or produce they were to raise or furnish, and the price at which, when prodnced, they were to deliver them to bis agents. It mast be adruitfed, Dorwithstanding the Erially improved the apricultmre of the country. But the vice of the system is, that the fellahs (cultivators) reap no advantage whatever from increase of prodaction Thear increased hbor, insteml of loringing with it an in. erease of comfort, brings only an increase of privation. This bystem could last to the present time enly ownm to the exceedingly pimitive and scanty nevin of the people, which explans the facility with which enor nous taxes, exacted by the Khedive, have been pad Tbu food, clothing, and lotnes of the tellinh cost nex to nothing. of late, however, a nurked improve buent has taker phace in the hoones and the whobe dition of the F,gyptian people will. it is to pe hated, be dition of the bigyptian perple will. It is to be hoped, be twally basters of this conntry bo their defeat of Ambi pachas (who had lieated atelnellath againat the khedive) it Tel-el-kebir, Sopt. 13, 18か2, his sulsiquent captur and banishment. Alexandria wits hembat deth and taken by the timgtish July 11,1882 , unt Catiro, the enpitul, oceuped by them in septemier following,-Inhatutants. These are composed of four difforent ricem, consistink of Copts, Aratis, Torka, anh, till 1512, Mamelnkis. ThiCipten are the origimal racs nal uppear to be descend

Elee'Iric, $n$. (Phys.) A substance whichmay, boder ordinary circhanstancss, be rendily made to evince electrical its propes by triction. Amber is a jowerml electric, and rabbed was bnown to the ancients. From the (ireek wurd for amber, the turms electric. electracily, elretrim scope, and many others, are derived. Electrics do not
transmit, or condnct, electricity; hence, they are fretransmit, or condnct, electricity; hence, they are fre-
quently termed non-conductors, or insulutors; while, on quently termed non-conductors, or insulutars; while, on
the other hand, anelvctics (q. v.) are transmitterx, of conductors, of electrical action. The most perfect elee trics are shell-lac, snlphur, umber, jut, resinous bodius, gums, guu-cotton, gliss, silk, diamond, agate, teurmaline, dry far, hair, woed, feathers, paper, turpentine, and varions oils, dry atnuspheric air, nud other gases, stenos of bigh elasticity, and ice at $0^{0}$ Fahr. The ficility of rapidly coudnctiug awny electricity prevents many solid bodies from beinr regarled as $E$, theorth all of them may be made to derelop electricity by friction. By insulating a metalice rod with a glass or resith
bindie, it may be made, like the glass tube, to develep bindte, it may be made, like
electricity. - See Electrictiy
Elee'trically, ado. In the manner of electicity, or
Elec'Iriealness, $n$. Quality of being electrical.

Eleefric'ity, $n$. [Fr. électricite; Sp. electricidèd; Jt. elkīn, to helkō, to draw, to drag, in reference to its attractive power.] (Physics.) One of the great forces of mature; also that branch of physical science whith has sprong from the investigation of phebomeva depending oll this particnlar force. The termis derived from the Greek electron, umber, in which substance the property of at-
tracting light bedits after friction was tirst observed. The fact that certain bodies, when rubbed, acquire the power of attracting light particles of natter, was kuown to the aucients. Thides, of Miletos, developed this property in amber 600 years before the Christian aera, and concladed that the substance was animated by an unknown epirit or element. Theophrastun, some centarivs later, olissrved the same attractive property in $n$ erystal termed the lyncurinm, now suppused to be the tonronaline. Pliny and other naturalists refer to the attractive power of annler ns somethiug well known, but say nothing to lead us to suppose that their know ledge of electrical phenomena went beyoni the discuv-
eries of the old philosophers. The first nitempt toward eries of the old philosophers. The first attempt toward
a gencralization of electrical phenemen was made toward the close of the 16th century, by D. Wm. Gilbert, in a treatise on the maguct. In the following century, Dr. Wall, Boyle, Newton, and others, accumblated many new ficts; but tbese were net of a nature to lead to the discovery of general principles. The electric park was first noticed by Dr. Wall. In tho early part of the last century, ir. Ilankshee made many electrical experiments, from which be ascertnibed that glass is a substance wbich can be readity electrified by friction: nod that some other bodies, espectally metals, treated in the same Danauer, manifest no electrical power Whatever. In $172 \lambda$, Mr. Strplseo Orey, a peasioner at which led to the discovery of electrical condaction, and which led to the diseovery of electrical condnction, and conductors. The conclusions arrived ut by Gry were frmly established by the researehes of Du Fay a french philesopher, to whom we are indebted for the discovery hat there are two oprosite states of electrical ex itth rion, in which fircos are developed attractive of each other. In 1745 ani 174i, numerons attempts were made th ronfine E. in glass vessels containing water or mercury; and, nlmost simmltaneonsly, Von Kleist in (iermuny, and Churens in IIOlland, became ocyuainted with tho disagreesble rfficefs of the electric slomk. Muschenbuek, of Leymen, rupented the experiments of Cumens,
 beyden jur, or plial. The discoveries of tirankliuf as the suronnfter, and grostly advanced the sefinace of $E$. 13 y suries of beantifnl exprimente with a common kite, this colpbratesl phitlosepher ascertained, what hat larent before cunfoctured, that lightning is an electracal phesomenon Fuvanligh nfterward entered with grent epirit inter the firld of elpotrical resparch, and thoraughly investigatemi the romblitions of houlicen chargend with $E$. Alant the

equal effect of heat on different metals in contact, and to the new branch of science which surung trom this observation he gave the name thermo- E, q. v. The pe-
cnliar pewer called $E$. is known to us only liy its effects, cnliar pewer called $E$ is known to us only lyy its effects, and snch terms as el-ctric current, and electric fluid are fur the nature of $E$ hise been whanced for resprctpose of explaining electrical whenomena. That of DuF and Synumer supposes $E$. to lne in in finitely stteumated flnid pervading all bodies, and composed of two primary elements pussersing distinct and opposite properties These elements, callid vitrcous and reginous elentricities. are supposel to uentralize each other when eombinel, electrical repose being the result. When, howerer. a disuuion of these elements takes place, earb hecomes active. In necurdance with this theory, elertrical exof the elemeuts in a sepraration and abstraction of one pensated. The thary existence of a single homedepeons ingouderphses the of extreme temnity and elasticity in a distribution throughont the nut-rial world. This fluid 3 assumed to the repulsive of its own particles, but it tractive of all other matter. When distributed in bodies, in quantities proportionate to their capacities or attraction for it, such bodies are salid to be in their natural state. Whell we increare or diminish the natural quantaty of $E$. in any smbstance, excitation is the result, and the substance, if over-charged, is satid to lie electritied postively, or, if underclarged, negaticely. the theories of sales and Cnindisi are less difective respectirely haved. and Frankin, upon which they are inadequate for the elacidation of electrimel plend fo Adopting the views of Fraday, ecientific matin of all nations now recomize two kinds of electrical force dis tinguished liyy the terms masitire and negotive but do not assume the existence of any pecnliar kind of matter to which the term electric fluitl may be applied. By frictional $E$. we distinguish that purtion of this subiect which relates to the phenomean of ordimary $E$ from these comparatively new sciences reforing to the phenomena attendant on electrical excitation hy chemical action, $E$, are illustrated by the The furdamental principles of E, are illuetrated by tiwe elrefric pondurm (Fig. 922). A zontally, is placed right aagles, 80 as to project hor on a convenient
stand. On the hook it which its upper end terminates, a cocoon thread is bung, to the end of which a pitch-lall is attached. The ball is thue doubly insulated by the glass and the silk of glass bo rubled of glass bo rubbed y a dry silk handbronght near the ball, the ball is at first briskly attractel, auil then as
 if the fibe be then moved townrds it, it moves off, phe the same distance fromit. The hall bein of allor charged, as it is called, a rem of shell-l: tracts is if wax, mer behig rublicd with mathel, at cuds it off exactly nome briskly than before, ant again ends it of exartly as the glass had duuc. If the glas recensury thubll will m-and rubler a second time nee sealing, the bart mowarda it as it did toward pulejone would heve takeluplace ir we had lema with the sealing-wax instead of the close tulio. Weinterpret this experiment in the following way. Whenglass is rubhed with silk, it becenus invested with a jeculiar property which gives evidence of its existence by attracting in pitch-ball or any other lifht substance; nul after conbact has commanicated this property to the ball of other matter, repulsion trkes place between them. In ingsequen of the bath lejng sispended ty na insulat mg thread, it rotaine the propsriy of rubibed glass thas given it; mom sthongh (hen ropelted by at holly having
 woperty of roblud sewline-wax lus replaced that of rnbbed glass in the lulh, the two similarly ufiet of butiew suis repel and the surne surtien of straction and rephlsions will continue if we present the clase mat the wax altermately to the ball. It in customary to call the E manifested ty kilses posime or ribrous, unt that ly senting-wax abl tablea of the same clana, negotine or resinous. Then kind of $F$. resulting from frictino nyjuare, however, to drpend on some prenliar conitithon of contart hetwren fir- rmbed raraves: thins suboth glans rubbed with silk or wool heconies poxitive, but the samo circumatincus, or emiry it neiunires, under when wilk igmblud with a mekantice charge Agoin, when rublyed with sullutgewax, pomitive. There are many sultataien which canath be excital in the arolibary way, hangh they muy be electrifor ly phane them in commamiention with an ex rited electrie. These are ermind anderifics, or more jironerly omductors, from their popierty of comdacting

## ELEC

ELEC
ELEC
the electric force. If an electrified pith hall, suspended by a thread, be touched by at electric, a stick of dry sealing-wax, for mistance, - its attra tive power will out te in any senbible degree ithcoonounication with the ground, it will instantly luse its electrical charge. It is theretiore evindent that electrics are non-conductors, or insudators, and that anelectrica
are trausmatters or condoctors of electrical action Modera rescarches have, however, proved that the difference betweeu the two classes is ouly one of dearee fereace betweed the two chases ; the very best conductors offer a certain resistance to the electrical disclarge, ant the most perfect insulators permit it to a small extent. The metals are by far the best conductora; shell-lac, sulphor, glas, silk, aod dry gas, the worst. Electrical discharges tak place silently and without disturhance in gond con ductors of sufficient size; but if the charge teose and the conductor very small, or imperfect from its nature, it is ofteo destroyed with viotence. When break is made in a conductor employed in effectug the discharge of athighy excited budy, distoption or sparkdischarire tikes phace across the iotervening air,
vided the ends of the conductor be not too distant; it is now well estublished that the electrie discharg will mat take place through all ahsolute vacum. Thio electrical spurf itself presents many points of ioterest in the madificatious to which it is liable. The time of traneit of the electrical force throngh a chain of ${ }^{2} 0$ couducting bodies of great length is so minute als obser
altogether ioappreciable to ordiary meaths of obsur vation. An electrified body exerts a peculiar influence apon neutral conductiog This infueace, which las been considerable distataces. This inay be thas examinel : Let two small cylioders of metal bo insmlated na supports of glass varnished with a solution of shell-iac io spirits of wine, and let these insulated conductors ine placed and to end a short distance upart. Niow, if on conductor be charged with positive E, it will induce a gegative state in the oearer portions of the other, an a positive stute in the more remote purts. The prects coadition of the second conductor cannot he properly iovestigated without the aid of the most dellicate elec troscopes; but with a shisjended pith ball the aitractive power of its distant extremity mity us remaly detected On remaving the electrifind contuctor, the becond cooductor at once loses its attrictive power. For exper
ments on electrical attraction and repulsion, a larg glass thbe will be found very useful. To exvits it, the rongh side of oiled silk (oiled ouly on one side) ruble over with a compasition corsistiog of an amalgatm of mercury, lead (or zioc), athl tin with a little grease, may be used, or in the alisence of such a rubber a soft dry silk handkerchief onay be employed. For external experimentation, however, and to exhibit the mechanical,
lnminous, and heating effects of the electrical discharge Inminous, and heating effects of the electrical discharge,
we require the electrical muchine. The first idea of such We require the electrical muchine. The first idea of such a macbine origioated withted a globe of hrimstuoe on an of M.ugdeburg, Who ownited a globe of hrmstuoe onan of his hand. In the electrical machioes now io nse, the electric to be excited is eicher a lymlow cylinder or a circular plate of glass. The eyliadrical machine is more simple io constraction and less liable to fracture. The

Fig. 923.-Electrical machine. (See aleo page 923.) plate machine (Fig. 923) consists of a thick plate of glass nonuted on a horizontal axis and turned lyy a craok At each end there is a giass standard, the one surmount by a brass lall called the meyative conductor, the oth. by a loay cylinder of brase with runaded eads, call the prime or possive con project two brase strips in the the negative combuctor project two brase strips inst the class plate. east through south to west; but if the cnrrent was made to ascend, then the durection of the motion wis re-
versed. Ampere subsequently cansed a magnet to rotate round ito owa axid; and Barlow devised an ingeajous apparatus for exhititing the rotation of a conduc Oersted's discovery of the reciprocal force exerted be tween magnetic burs aud conducting-wires, was made by Schweigger, a German physicist, in the construction of an instrament for indicatiag the direction and measuring the intensity of voltaic currents. (See GalvasOMgTzr.) The laws of electro-magnetic action were
folly doveloped by Ampere, wion must be regordud folly developed by Ampere, who must be regarded as
one of the preatest plilosophers of this ceniury one of the treatest plilosophers of this century. In
the course of his tavestigations he discovered a noaster of extremely interesting phemuluchat reaulting Irom the of cxtremely interesting phemandenat reaulting from the
action of electrial currents on each other, which become evident when arrmgements are made for giving mobility to the couductiog-wres. He found that wheo two carrents flowing io the same direction were made to approach earh other, etroug attraction took place betweent them, aud when in un oppesite direction, un equally etroogr rupulsion. These effects hatreatisolntely no relatiou that can be traced to ordinary electrical attractions and repulsions, from which they most be
carefully distinguisled. They are purely dynamic, carefully distinguished. They are purely dynumic,
having to do with electricity in motion; and henee they having to do with electricity in motion; and henee they
are generally treated of under the luad of efectrody are getuerally treated of uniter the head of efectro-dy-
namics. Uphn those attruetions and ripulsonn of comghanucs. Cphn thuse attructions abd ripulsions of cols-
ducting-wires Ampere founded a most beantifal and ductimg-wires Ampere founded at most beantifal and
ingenious hypothesis of monnetic actions in gencral which explaius very clarly the influence of the curreut on the aeedle. He found that at striking amaluy en isted between wirea coaductang electricity ind nagnets, whea the former were turned, corkscrew-fashion, into helices. A helix has inaced all the properties of a matg aet, bat the nature of the pele at either end will depen on the direction of the turns of the helix; if these be from left to right, then the extremity at which the curreat cuters wall have the pagnetic properties of a north pole for if the helix be a lett-handed one, then the ex netic properties of a fouth pols. The analogy thag to fricture. It a marnetic bar be anogy exterdo piece is a perfect uagnet, and the fractured parts have opposite poles; so it is with the helix, which, if divided ends. middle, exhibits attraction between tho fractured ism, the phenonumin to Amperce theory of mazaet voltuic currents circulating rouud its molecules. In their mexcited state, these melecular currents move in ell directions, and thus neutralize one mother; but Wher the tar becomes a magnet, the curreuts nove paraltel to eath ofber, and in the same darection, and the
effect probluced is that of a uniform current noving corkscrew-fashion routad the bar, which that hecomusing effect a helix: and the attractions and repuleions are consequences of the actions of the currents on carl other. In applying this theory to the explamation of to sappose the incessant circulation of electrical currents round the globe from east to west perpendicular to the magnetic meridian. (Eee Magnelism.) A con siduration of the influcoce exerted by electrical currents on mignete naturatly led to the conclusion that the nentral condition of bodies susceptible of magnetisn wonld he distarbed by an electractal corrent, and this conclueluctries quickly reritied by experimente. When an iron or cteel, the latter acquige angles to a piece of eithor temperary or permanent as magnetio pwharity, direction of the curreut determining the positiou be, the poles. This effect is prodipiously iucrensed by canein the current to circulate is number of times rombd the bar, which then acquires extrardinarymagnetie power A steel Inar maty bo permamently magnetized in this way but a bar of pare and suft irun retains the nagketic force only ko long as the electrical carrent is circulating round it. Ilars of iron thus temporarily matentized are catied electromaghets. The strongest are furet-bhuewhiped, is whe conducting-wire, whind is womad sewral times
romad them, is the ordimary cenpper bell-wire, covered with sitk potion. The punere of the ineletromagnet deyends on the dimennlaus of the lar, the purity current, and on the ling of the and thifkneas of the corered wire. One has already latell constructed

afterwards the nause of $g^{\prime}$ yphegraphy.
Elec'trotype, $n$. [Fr., trom Gir, elehtron, and typos, an metals in or upon suitable montis, throper and other of voltaic electricity, so as to produce faithful copers of coibs, medals. statues, ebgrived blecks, und uther works: invented in $183 \mathrm{~F}^{\circ}$ by Proteosor Jacobi, of St. Petersburg. Tbe following examples of electrolysis (see this word will elucidate this important branch of electro-metal. lurgy. If two platiamm plates be coanected with the opposite euds of a voltac battery in action, sud be
placed io a vessel contaning water und sulpinuric acid, the water will he electrolyzed, or decomynatd by elec tricity: the hydrugen gas will be relasial at the plate oxygen at that connected with the pusitive. Itinto the arid liquid some crystals of sulphato of copper (Ghe vitriol) be new thrown, thetrolysis will still tuber place but only ooe of the elements of the water, manaly, exy gen, will be evolved; for the bylrogen, an being releasel from the watter, will take the place of the copper in the solution, and the copper thas liberated will be deposited oa the segative plate. This experiment may be continued until all the copper is alsatructid from the solution. If a copper plate be aow bubstituted for the platinum decomposed, hat neither of the gases will esrape. The hydrogen, as before, will take the place of the copper in positive plate, will combine with the copper of which pusitive plate, will combine mith the coppor of whe which will unite with the sulphuric acid to form sutphate of copper. The chemical forees called into action by the curreat are so leantifally balnacet, tbat, in the last experiment, the quantity of copper supplied liy tho poStive phtite equals exactly the quantity withdrawn from the solntion, and deposited on the negative plate. The practice of electrotypieg consists in preparang models or aboulds of oljects to be copled, and in so arrangiog
the battery, or appinatus, which generates the voltaic the battery, or apparatus, which genarater the voltalid
current, as to depusit the metal in a compact snd solial form upon theae models. There are many materials fitted for forming electrotype-monlds; of these, fusible metal, wax, stetarine, plister of laris, and gutta-perchn, are uustly used. Nun-metallic moulds are rubled ove with plublago or black-lead, which is an excellent conductor of electricity. The niplication of thia sulastance to nut-conducting 6urfacrs was recommended by Mr Wax or tallow, or cuvered with fine varnisl), before the are placed iu the curper solution. The simplest kinil of voltaic apparaths for cemetrotyping is a siugle cell o stoneware or glass is placed a tube or call of purous
earthenware, and in this a plate or mol of unulgamnted

6 bardly any curve or position which it cannet assmman at the will of the anmal, nor any substance, large of phame's pomp, his drinking-cny. his water-reservoir, his powdering apparatus with which he puffs the collected dust over his mosstened hide to protect it from flies, his roraying instrutuent with which he cellects hie fred, anl hia all-powerfill srm. The eliphant is a hage, un-wieldy-looking abma, with a maked, thick, callons and wrinkled skit, generally of a dirty gray or blackinh but light owing to an exteusive shin cellery think, larsely feveloped batwe and seprating the outer und intur tables. The chamber which contains the brain is cuaparatively small, and thongn these animals sre proverhially considered very intelligent, the brain tself is small in proportion to that $n$ the dug or horse, and is only about equal to that of the pig. The eve is very small, but extremely quick, aut the ears are of great sizo. The averaze height of the male elephant is bhout ten feet from the wither or top of the sboulder. In the wild state, elephants live in troops, and inlabit ouly the most solitary torests of tropical Asia and southro Africt. The of mates march at the head of the They live upon vegetable food and puver att her rear broteanimals, but when attacked them, they defend thenuselves with great conrage and fury The honting of elephants in rone places, as in Ceylon is an importang ffair. A great many men are employed, the animals are taken alive, sometimes 100 ur 130 at a time, and suld to the native princes in different parts of India. They are cunght withont much diffienity, and are readily tamed. In captivity they show great intelligence and docility, and are eakily rendered most nseful amiansle to man, thongh their reasuning puwers have been very much exaggerated. In ancient times they were nsed in war, hot nuwadays they are only employed as teasts of They are by no meane conrageons smimale, and at the kound of fire-arms they become panic-struck and fy. They couple in the same baanner ne other quadrupeds. The teats of the female are situated on the chest; and the young suckle the teat with their meuthe, nnd not with their trunkin, ss has ofteo been alleged. Onty two species are found recent. One, inhabiting Asia, Elephas Indicus, the Indian elephant, teuanting nany parte of
India, from the Intus to the Eastern Ocean, and the India, from the Intus to the Fastern Ocean, and the adjacent large islands, especially Ceylon, has the molar
teeth with narrow transverse ridges, and possesses funr reeth with narrow transvetse ridges, and possessee funr
nails to the hind feet $;$ while the other, inhahitiug Sunthmails to the hind fcet; while the other, inhahitiug Sonth-
ern Africa, Elephas ( $L$ wodnnta) Africanus, nod found extending from Senegal to the Cape of Good Nople, hite the molar teeth with lozenge-shaped ridges, only three toes on the hinder feet, and very harge ears. Thie tusky in this species are generally larger then in the preceding, and the females have them of considerable size also, The ivory olitained from the African elephant is more esteened in the trade than that from the Indian species.
-To this fitmily belong also the extinct genera Mam Mn7 $I 1$ and M ssponov, $q$. e .

## Elephan'time, $a$. Pertaining to the elephant.-Ilnge;

 (PaL.) Noting a pant.(PaL.) Noting a period distiuguished for large pachyderantons animals resombling the elephant.- Muntell. Eleplian'tine, a small island of the Nile, lying opposite to Assouan on the confines of Egypt and Nuhia,

lin'bryo, n. [Fr, embryan; Gr. embryon, from en, and tryo, to be full of anything, to swell therewith.] A
ortanized being in a rudioientary condtion, or the ri diment from which, under fivurable circumstances, an diment from which, under foveradized body is to be developed. - The beginning or
organize
the first state of anytbing in its first radiments or unthe first state
fimished state.
(Bot.) The radiment of the future plant existing in the seed; the vegetable foetus. The truo $\bar{E}$ is the ensential characteristic of the sed of fluwering plats; for a
spore, as the reproductive part of a flowerless plant is spore, as the reprobuctive part of a flowerless piant is
called, has no true $E$, the radimentary plant being unly called, has no true $E$, the rudimentary phamt The $\boldsymbol{E}$. is disided into three parts, corruphinding to the spectively, the rudicle, the plumule, amil tho cotyledon. These parts may be readily recognizelit in many seels, especially when the process of germination is a littl
advanced. Plants which have seeds with 2 cotyledun are colled dicolyledomous, and those lanving seeds com monly possussiny but one cotyldon aresaid to be momo-
cotylendonows. Flownrless plants aro said to be acotylecotyletomons. Flowrless plants aro said to be acotyle-
dontous. When albumen is present in a seed, the size of the $E$. is in inverse proportion to its quantity; tans in grasses there is a larger deposit of albumen, bint a very bumen small. When the E, is external to the albumen ummensmall. When the E. is external to the abomes it saill to be externul; when it is sarrounded by the allonmen on all sides, except at its rudicular extremity, as in cions of hile sumber favorable circumstances, that there are well attested instances of its haviog preserved ite vitality mach leyomil 1,000 yente.

gineer. The formation of artificial harhors by throwing out piers and jetties: and the clearage of natural harsandbank ; ind the constraction of the great sewer and draiss that rub in every direction under our large towns and citiss, all come under his care: and, in addition to this, he has to superintend the construction ef the shafts and machinery of mines and coal-pits, to in sure safcty to the miners in their abcent and descent and to secure proper and thorobgh ventilation in al parts of the mine. Another Geat brach ofs cuaps bydraulic and lever proses, loome, nod steam-th-ime oydraulic and lever premsex, home, abd sream-engime vessels, or for setting machinery in mostion. in short the civil engineer seceks to adapt the mechavical powert and their applanaces, and bring theniotosuch forms and combinations that they may furmish the means of saving the expenditure and waste of aaimal strength and manusl labor, and thereby canse the work to be dune at a chaper rite, and in a more efficient maner It is only witlin the last three centuries that the prowhether of arctivilect, pariter, semptor, and engine timet callings. Tluse of the civil and military engioeer lame chiefly been clicited and catablished by the ioven tion of gapowder and cangon, whith necessitated the employmeot of peculiar skill, and close study in planning and constructing the works of defence that snrround any place of importance; and the requirementh of commerce, which hats long siace demanded, und atill demands, canale, rouds, railroars, and motive power beyond the constant control of the winds and waves for the convryance of merchandise by land or sea. Al though we may consider Archimenes hs the first ebpineer of whom mention is made in histury, in memorable chaoical powere, yet the early mations of the world, ea pecially tho Euyptians, who raised and fixed in their present position the gigantic blocks that form the prramids, and reared the mighty wonolithe known as Pompey's lijliar and Cleopatra's Needles, must have heen pusserscl of encineers of no ordinary mental capacity The blocke that form the Cyclopean wall of Tirgus and Dycenæ, the marble columns and the tempies of the Greeks, the sewerage and agncducts of Rome, the underground structures fur the drainage of the Assyrian city of Nimred, the canal of Xerxes, that separated Mount Atlas from the mainland, and the remains of those found on varions parts of Egyfi, Assyria, and the East, all tell tiquity designed and carried out, whuse names are lost for us A goog the angineers who flourixhed lefore the for us, Aruong the angimeers who flowifhed wefore the the d-feoce of Syracuse, is the earliest on tecord, unless we consider IHrim, the clever Tyrian artificer, who aided Solumon in the building of the Temple, as an engineer. as he doubtlexs whs. The writings of Vitruvins prove him to have been employed in the structore of omilitary machines and works of defence, ats well as on architect. In the Middle Ages, and even in later periods, we still find the professions we have mentionedrthovecotnbined in one person; for the eminent Brunelleschi, and Niconetructing, futificutions, and the illu-trions peninter Lcomardo da Vinci remerine an important acrvice in the eqpacity of eugineer, by the construction of thu furst canal-lock that was ever used to afford mems of communication between waters on different levels. Among engineors of the 16th century, Albert Diirar, the panter and rongraver, may be maned, who wrote to some extent on the science of fortification. But at this time considrable akill in C: E. had already heen nttaneed, both in N . Italy and Ilahand. At the end of the 16 th centiry, the profession of the malitary engimer hagath to be bronghit into greater prominence, atod to be considered as roquiring epectial qualificatinas in him who might
 nay be consilered tem of military engiterriag. The $E$ works of the $\mathbf{U}$ Statem are extuhited in its lotug lines of railrome its canmla, its dry-dock , fortificatimas, light-honses, brenk watera, lirilges. \&c. The graduates of the military neloon of Wwat Point are qualified as military encinewre nod aro nime inntructed in the primeiples of the other departments of the profeesion. The title of Civil Eaginowr (C. S.) is legatly eonferred hy the polytechmic achool ut Troy. N. Y., apan ita graduated

## ENGR

#### Abstract

reny early period of th-ir history, although none of them ever distovered the practicability of tahiny int pressions from incised plates, or woolen figuris in rellief is said to have prodnced a map of all the portions of the world that were known to the ancients at that periot, griven on a plate of brass. The incised lines prolably filledi in with a colored compusition, wo thit the whole presented an appearance somewhat simhind the niello-work of the Midtle Ages, or the second kint of the early encanstic paintimgs. (Sve Excaustic Panstat Niello.) The method of producing incised engrat inga on plates of metal for the pinrjose of arnament tinn. Was followed without the carliest times notil the miscover of ex the art of printing, nad the male of takin? inpressions from engravei plates. The art of obtanimp no impriat from woulen bochis and types is ascribed to Lanrence Koster, of Itanteon, who printed a luok of rnde wood-eograviogs on scripture suljects, with texts of Scriptare nt the foot of cach parint, entiticd specuitan Hamane Satrationis, abont the year 1tos; merit of the earlient discoviry of printing from metal plates is assizped to dasson impression on paper from a large silver, jutat kuown as the "Pux," winich be was cincravimg in mith about 12 years after the discovery of Rostet, who Ait. theo printing from movable typus cut man lalisus in thas, the progress made byetal wiss rabisi, and before the engraving on woud andary, books wire product copiunsly illnstrated with maps and engraviags imprintid from metal plates. Prior to the time of Albert Durer. et griviug had beed effecterl by means of the graving-tou alone; but this great artist introducest the mothot of engraving knowa as etching, by which the destin is bitten in, is it is terhoically callet, by the cormote after tiva of a strong acid on tho surfice of the phete ander the design has heed trace withane hased previonsly cor gronnid, with which the plate has ered. It should, however, be stated that the discover to Parmumiana, who lived at the same tmae as Alher Diarer. The style of engraviog called "mezzutinto Wats introdnced by De Sirgea nhont 1640 ; considerable inprovements wore subsequently effected io this liranch of the art by Prince Rupert. Copper wiss the mat terial used for all ungravings, whether of maps ground scapes, in line, aquatinta, stiplea soft steel plates wer first asod ly Messrs. Perkios and Il ath, of Philadesplai instead of cupper, which were afterwards burdenca tools the process of engraving had brea erfectef. Thinds and nsed in engraving are uravers or onde of chse-hard steel, etchiny-aeedles scrapersfor removing the borr throwo up by the graver or dry point, and burnishers to remove scratches from the plate, und to give at tone and finish to the engrav ing. The phate is prepared for the reception of the d sign ly covering it with a conting of etching-gronus cumposed uf a mixture of wix, resi, Has suon heated This is smeared over the plite itfer ft has the prumut cire heing titken to render the surface of it over the uniform. It is then and as som ats this is done the plate is allowed to cool.' The outline of the drawing or maty to be engraved, which hisk been car the gromm by prescil on paper, is next trinsferred sure, or by rubling it with a burni-her, and the design sure, or abtaned is traced through the gronnd with Heedle. A rim is then raised round the edze of the plate with what is called "banking-way, anta solution of nitric acid aod water is pouren into tho hollow thins formen. When this has remained on the phate a sufficient time to lite in the ontline, or the lighter parto of  pourod off, and the parts which are dors edegroud covered with a kind uirmish of the aill, and provents is which resists the corrosion the parts thins covered. The from acting on the platectel to the sution of the reil and the process of applying the stoppius-ground to those parte which are sufficiently dark, and the acin to thon parts which are sumcientigh, is continuel until all the requisite gradations of light and shale have been ob taincl. The plate is afferwards finished with the graver Io line-enaravings, the greater part of the work by the barin, a stilful engravrr bed atie to protace vivid representation of the surface of any ubger or and terial by a judicims com Fingross', $r$. a. Homer's uame shall live fo epic sotg.' - Dryder-
-n. Epic, or Epic Pretry, is a kind of poetry which has from lyric poetry, which deals with the inmer feelingsand emotions of the mind. The distinction is geoeral, for there sre few prodnctions to which it caustrictly apply but they belong to the ose clats or theother, according to the predominatiny character. As in the individeal man, so with the human race, the mind is objective before it is snljective; it observes extermal objects before it turns its thonglits in apon itself; sad heace we may conclude that the $E$. was the earliest species of poetry The earliest specimens of this form of art probably cou-
sisted of simple tales rhythmically arranged, and recited to a very simple mosical accompaniment. The longer and more artistic epic poems, however, embrace an ex and more artistic epic poems, howerre, embern series of events and the actions of numerous prosonages. The epic poetry of the early Greeks natumany dicepos of 11 oner, and the hieratic epos of Hesiod, the une dealing with the political, the other with the
religious, life of the Greeks. The Iliad and Odysery of religious, life of the Greeks. The Iliad and Odyssry of
Homer preseat us with the finest specimens of thisclass Homer present us with the finest apecimens of thisclass
of poetry that have ever appeared. The sacred poetry of poetry that have ever aplueared. The nacred poetry
of ilesiod partakes very much of a Iyrical character, The Enetd of Virgil is not equal to the lhad of Jomer as an $E$.; its snperionity depending more on
beauty of landuage and arrangenment than no anything beauty of lansuage and arrangement than on anything
in the story. The greatest $E$. of modero times is the Poradise Last of Milton. Dante's Dirine Comedy, however sublime in style, is destitute of that unity of event or sction necessary to constituto a great work of this and strictly an $E$., and adorned with sll the beauties that belong to this species of composition. The epic poem is of all poetical works the most dignified, and at the same time the most difficnit in execution; and hence it is that so very few have sncceeded in the atteapt to produce a really great $E$. To coatrivea story whi sonall picase amportant, aud instructive; to fill it with suitable inciimportant, aud inotructive; to fill it with snitable incldescriptions - and throwchout a long work to maintain that propriety of sentiment, and that elevation of style, which the epic charsicter requires, - is unquestionably the highest effort of poetical genins."-Blair's Rhetoric Epiea'ly x. n. (Bot.) The term applied by many botanists to a circle of liracts appearing inmediately below the calyx or onter covering of the flower. It is seed in the mallow tribe, and in many plants of the pink aod rose tribes. Thongh a distinct bame has been given the

Epica'riss. a celebrated Greek philosopher, founder of father, Nescles was an Ather Eather, Nescles, Was anathenias coluse in that island. Epicurus stadied phitasophy and Latnpsacus, and in B. C. sob settled at A thena, and in a garden which he hought there ofnened his echool of philosophy. The fundamental dectrine of Epicurus in morals is, that pleasure is the suvertign gove. He tanght that this must be songlit hy the aid of reason; that prudence is the first of virtues, and that moral excellence is only of value as condocing to pleasure. He denied the immortality of the noul, and aseerted the existence of the gods, their perfert reprase, and their iodiference to hmanamair. In physica le adopted the atomic theary, applying it to the gords thernjustification of a sensual life, $\mathcal{E}$. obtained the pruse even of his adversaries for the simple, pure, add manly life he himself led. His works are host, hut some frasments of his book On Nature werediscovered at Herculaneun. The great poem of Lacretins, De Rerum Nutura, is ma expositiun of the cystem of this great philosopher.

 corrmonondence in condition; ns, to lie oo it froting of equality.-Unifurmity ; bimilirity ; platunens: as, equality of aurfuce,-Sumeness in state, condition, or conree ; as, murfity of constitution.
(Math.) Lxact roncorl of quantlty hertween two magnitudes, denoted by the sign =: ns, for instance, $b=y$ conveys the menaing that $b$ contains an ldentical number of vults with $y$.
(Lave.) Likeness in poasessing the sume rightm, and
 may powseas over others. All permon uro jriter tel by the law, and ohedience to it is requireml from all.
Equial'ity, in Minais, a post-village. cal, of Gallatin co, on Ruline Ceveh, nbt, ini m. S.s. F . of Spriagfleld; pop. uht, \$100.
 sifins, or mate of inclog enpinilymel.
:'quillee, $\quad$, a. [Fir, rgmiser.] To makn mual or alike; Co make even nr unifirm; as, to equalize accombes. -

Fignally, orir. in an equal manber; evealy; unffurmly ; un, they are cqually matchod.

## EQUA

EQUI
EQUI
889

E'qualness, $n$. A state of heing corresponding or
Equau'世ular, $a$. Javing eyual angles.
Equanitu'ity, $n$. [Lat. aquaninitos-aquas, eqnal, Equanimity,
eveo. and animus, mind. Sce Axim ite.] Evenners of
mind. uniformity and steroliness of temper; that calm
 elated or depressed; es, nothing can bhake bia equa-
Eiumant, $n$. [Lat, aquen, I make equal.] (Ptnlemaic Astrim.) Among the ancients this term denoted a circle which was conceived to be described in the plane of the deferent or eccentric, for regnlating and ndjusting certuin motions of the planets, hod reducing them to easier
calculation.
Equate', v. a. [Lat. requo, equatus] To make equal ; motion ; as, to equate distances.
Equation, (é-kwá'shon,) n. [Fr. équation; Lat, aquation.] (Nath.) A term given to the symbolical expreseion of the quality of two quantities. The sign =, placed between the two quantities, signifies that they are equal. Thas $5 x+10=25$, is an $E$. expressing the equality of the quantities $5 x+10$ and 25 . A simple $E$. is that which contains only the fint powrr of the anknown quantity or quantities. Pore equations of the
higher degrees are those which contain the bquare or bigher degrees are those which cown quantity, and ore any higher power of tue unknown quanted into two classes - pore and affected. A pare $E$ is that io which only one power of the unk nown quantity is involved; and an affected $E$. is that is which different powers of the unknown quantity sre ievolved. Thus, $a x^{2}=b$ is a pure $\boldsymbol{E}_{\text {, and }} a x^{2}+b x$ $=\mathrm{c}$ is an affected $E$. An affected quadratic $E$. is that which contains the square of the unknown
quantity and slso the anknown quantity itself. An $E$. guantity and also the anknown quantity itself. An E. is said to be algebraic when the operations to which
the nuknown quantity $x$ is subjected do not transcend the unknown quantity $x$ is subjected do not transcend
the ordinary algebraical operations of addition, sabthe ordinary algebraical operations of addition, sub-
traction, maltiplication, division. involution, and evolutraction, multiplication, division. involution, and evolu-
tion; in other cases the $E$. is termed transcendent, and tion; in other cases the distinctive names of exponential, logarithmic, trigonometrical, \&c., according to the nature of the functions of $x$ which it involves. An algebnuic $E$. is further said to be rutionol and inegral when, in it, the unknown quantity neither appears in the denominator of a fraction nor uader any radical sign. It is evident that every algehraic $\boldsymbol{E}$. can lie rendered rational and integral by means of appropriate transformation
Bin omial Equition; Recrprocal Equation. (Astron.) The difference between the apparent

Eqitalion of ihe Centre. (Astron.) The quantity by which the true longitude of the earth differs Equation of the Efininax. (Astron.) The equinox.
Equa'tion of Payunents. (Arith.) The method of d-termining the mean time of p
Equa'tion of Time. (Astron.) The diffrence expressed in mean solar time, between the true or upparent right ascension of the sun and its mean riglit the difference between the times indicated by an accurately constracted sun-dial and a well-regulated clock. The $\boldsymbol{E}$ of $\Gamma$. arises from the combined operation of alt
the causes which tend to produce inequalities of the the canses which tend to produce inequalities of the
enn's motion in right ascension. The first of these is the eccentricity of the earth orbit, in consequence of which the sun's motion in longitnde is nnequal. The
seemd is the obliquity of the ecliptic, is consequence of which the arcz of the ecliptic aod equator, counting from the intersection of these circles to the meridian, are, in general, unequal. A third, but comparatively nnimportant, cause arises from the perturbations of the moon and planets. The $E$ of $T$ is ut its maximum alt. the beginning of Nov, when it amount to about 16 min. 16 sec .; and is sulbtractive, that is to say, the clock
is faster than the dial liy that quantity. At fonr times is faster than the dial liy that quantity. At fonr times
in the year, the equation vanishes, or the clock-time in the year, the equation vanishes, or the clock-time
and the dial-time agree. This happons about the 25 th and the dial-time agree. This happ ats alonut the 25 th epochs, depending on the longitude of the sun's periepochs, depending on the longitud
ges. sre subject to bome varration.
 from anun, to nuake equal.] ( $G$ ing.) The great circle distant from the two poles, and divides the parth int the $\mathbf{N}_{+}$and S. hemispheres. Terrestrial Longitudes a neasured on the $\boldsymbol{E}$. or some of its parallel circles, co mencing from some arlitrary point-most nations adopt ing the weridian which passes through their capital city. Latitudes are connted from the E, along the meriman. which the plane ie perpendicalar to the axis of the earth's diarnal motion. When the sun is in its plane the days and nights are equal everywhere. The $\boldsymbol{E}$. divides the sylhere 1nto the $\mathbf{N}$. and $\mathbf{S}^{\text {S }}$. bemisphpres, and the apparent diorosl motions of all the celestial lodiet
right ascensions are measured on the $E$; and tho tlec-
linations on circles which internct it nt right angles. limations on circles which intersact $\boldsymbol{E}$, in the hesvene, is often stylmi the equinnchal.
The
(Geng) Nime given in $157+$ to those provinces of th Upper Nite nad lake region, in Central Africa, Intely annexed to Fgypt. An extent of t-rritery larger thas that portion of the U. S. east of the Misainsippt River. Equatorini, o. Relating or pertaining to the equator monnted for the purpowe of continuously observing and buting the riaht ascensiona and diclitation of a celestial boily sitanted in any part of the visilile havens. The principal axis of the +quatorial moniting is parimel porsible to Yollow a stive from risise and settins by ponsing the telescone, enther liy lang or machusery westward, at the same ruten at which the earth's mution carries it enstward. On the palar axis there in fixed a graduated circle, tho plane of which is perpendicular to the polar axis, nul therefore parallel to the emrth' equator. This is called the hour cirele, and in furnished with two indices. If ohe he set to milereal time at the place of olservation, which of eourse represents the right ascensiun of the part of the hemvens thein crussing the meridian, the other index will show the right hs points. In thas manuer the ribht nwonkion of a comet for instance, way be ut ence foumbl, or the teluacour may be pointed to may given right a*consion. But the telescopa itself is attiuhtied to unotler axis, called the declinution oxix, at right naghes to the former ono; and to this axis is nlso attuched nt right angles monther circle, the declination circle. The phane of the second circle and of the telescoper motion in dechanation is thm in all positions ut right angles to the plane of the first or equatorial circie. Now it is ensy to conceive, from this genera! descripition, that when the telescope is polned to a star, the angle between the direction of tie celescope nad the pular uxis is equal to the polar dis-
taace of the star; and by sotting the index of the doclination circle to zero when the tulesicope is at right angles to the polar axis, the declimation of a star in registerell in all poritimus of the instrnment; conase quently, when a motion is given to the polar uxis with out altering the pusition of the telescope on the de clination circle, the point to which the telescopes is directed will always lie in the small circle of the heaven coincident with a star s diurbal yath: and bence, if tho motion communicated to the polar axis be eqnal to the in the field. This motion of rotation is communicated in the field. This motion of rotation is communicate
Edatatorial Curreni. (Phys. Geography.) An im dasatorial Curreni. (Phys. Geography.) An im-
portant part of the stream corrents of the Atlantic, first distinctly traceable off the coast of Africa, a little south of the equator, whence it continues to run, nearly on the linc, for a distntice of 1,000 miles as far as $22^{\circ} \mathrm{W}$. Loa. It then sends off a branch to the N.W., and declining southward runs for simme distance parallel to the coast of S . America, until it ia lost sight of near the month of the Amazons. Including both brnnches, it has in course of about $4,000 \mathrm{~m}$. Its breadth, at first only $130 \mathrm{~m}_{\text {. }}$ becomes three tiones as great where it brunche locity of 36 m . jer day, but at certain seasons, and in locity of 36 on . jer day, but at certain beasons, and in
some parts of its course, it has been recorded as reachsome parts of its course, it hase than $31 / 2 \mathrm{~m}$. per hour. It in generally through. ing more than $31 / 2 \mathrm{~mm}$. per hamr. It is generally through
ont its course a cold carrent, lunt the difference is not more than 4 or 5 degrees when compared with the mean tempenture of the ocent in any given latitide. The N. portion of this great enrrent passurs along the coast of Guinen and enters the Cariblean Bea, where it is ultimately lost, or perliaps is converted into warm water, aud thesn is passed out through the Gulf of Mexico into the Atlantic to ussist in forming the
Eqnain'rialiy, adv. So as to have the motions of an site the cquator:
Equerry, (e-kweri,) n. [L. Lat. equariws, one who Lat equus, a hurse. See Equrstnis.] One who hus the charge of horses; specifically, a term applied to an officer sttached to the household of n sovereign prince, or great noble, who attends on horselack during visits, progresses, \&c. Io England, the royal equerries bol secnall rank, after the mater of the torses,
Eques'irian, a. [Fr. stinnty W., and N. W, or S.W. wlmin contamally prevail; besiches which, in vonsequence of ita shallowness, a part is obstructed by ice for sonu wiske in the spring after the navigation uf the other lakes is open atad nuimpeded Towards the W. extremity thate are several groups of
 lut-in B.y, with $12 \mathrm{f}_{\mathrm{f}+\mathrm{t}}$ of wither. On the N. nhore seviral promontorios jut into the lake, the priacipal of Wlich are the N. und S. Forolands, and Point landgaaril, Except the Detruit, Lake Erie reretves few rivers of aey conseqnence, and all, withuut exception, have barn at
their months. The Guse or Welland, which tuites with ity E. extremity, is its princinsl ufthent, and has heen Cinal, of which it forms a part connectiog Wellan Erie and Ontario, uad aroiding the Falie of Niagara The Erie Canal, 363 m . Lung, runs from the city of length, extends from Cleveland, at the mouth of tha Cuyahoga, to the Scioto, a litile S. of Colunbus. The former of these camals places Lake Erie in commnnication with the Atlaatic; the latter connecte it with the
Gulf of Florida. IBffalo. Doukirk, Ashtabula, CleveGnif of Floridi. Buffato, Dathkirk, Aslitabula, Cleve priacipal towns on this lake witlip the troit are the principal towns on this lake, within the territuries of hrooko in those belonsing to Great britain.
Bittle of Lake Erie. (Amer. Hist.) In the war be twees the U. S. and Great Britain in 1812 , the posscssion of lakes Erie and Ontario, ns a theatre for warlike operations, became an object of importace to both of the belligerents, and, accordingly, strentons efforts were made by either party to socure for themeelves the alvaintages to be derived therefron. The chief command of
the American maval equadron on Ontario wis held by the American maval equadron on Ontario wns held by
Comomodore Channcry; that of Erie hy Master-Cnen-
 manifat Oliver Hazard Perry of Rhole Ishad, then
only 27 years of age. Perry litted out a squadron of eail at Erie, and succeeded in ronuing the British Llockade early in Aog., 1813. Gn the loth Sept. following, while lying in Pot-in Bay, wear the W. extremity of the lake, the British squadron was seen in the offiog, when Perry went ont to meet it. The enemy consisted of 6 brigs, schnoaers, \&c., mounting 63 gans, and manned hy 502 officrrs and men, noder the command of Commodore Barclay, an old Trafalgar hero. Selecting the British flugalip Drtrat (19 guns) as bie antugocist Perry attacked her io the Lawrence, a hrig of 20 gans and a general artion ensiged, the British force, thongh and 12 men. The battle saron became forions, 9 gun abont two hours after the action, the farious, a ad in completely di⿰abled, and struck ber flag. ppon which Compmodere Perry shitted his flag to the Ningura, and continued the action, which, after hours more of desperate fighting. was lrought to ae end hy the utter iog Captin Fimis of the Queen Chartorte), Rot 9 wonnded ( 9 of whom were officero): Comnodure Barclay himself receiving two serions ghape-shot woueds. The Americata lose was $2 t$ kilted, including 3 ofheers. 1 m portint resnits were achieved by this haril-won setion American supremacy on the lakes being estabhished, and

adjuinmg.) (Mol.) The name given to a pelag, near or
andiar kind of anthmamation of the skim, so called from its tendency to spreal to aljoining parts. It is knowo also as St Antbony's fire or igmis sacer, and in commen langusge as the Rose. It noost commenly attacks the head sad face; but it also sometimer occurs on other parts of the body. The local inflammation is preceded and accompanied with fever, anl there ore usually certain pre nonitory symptonis that precede the outbresk of the discase; the patient feels int, - shivery, feeble, langnid. for sowe time, i real spot appetare on some part of th for some time, a real spot appeara on some part of the
Lody, accompanied with a barning heat and tingling. When atticking the face, it usually makes its appear ance on the bridge of the nuse, and rapislly extends it self to the eyelids, cheeks, a od forehead. The redness is nut intense, lint rather of $a$ pale rose-color, and goes away tempurarily on pressure, bnt returns immedintely on its rumoval, and no pit remains after the prossnre. By the second night, of marning of the third day, after the commencement of the fever, the fice liegine to swell,
the eves are completuly tlosed, and the form of the features saarcely recognizable. On tho fourth or fitth thay, orsnusidu on the fifth or six th, when than reluess changes to a yellowish hue, rul the swelling and fever legin to limiuish; wnl on the ejohth day they looth disajper the progress of the disease, howiver, is nore rmpid and its cumree of shorter duration in the jounk and sannuine than in those more adrauced in life; the tamefaction in the former being sumetimes fully formed on the 'becond day, and the whole terminating on the kixth or seventh, while in the latter it may be protracted to the tenth or twelfth. Suppuration rarely occurs, except occasionally in the eyelids or scalp. Sometimes the intlammation and swenng extend to the meck and throst, and may poma come on, sod death ensmes fromes effusion on thi coms coms on, sod death ensues from effusion on the pearance of the intlammation; luat, on the contrary, it generally increases with the progress of the inflammation, and only ceases when it goes away. When the complaint is milh, the inflammation und fever generally cease granlially withmitany evident crisis. Among fri quent causus of this disense, are expostare to a cold end moist atmosphere, sndden changes of temperature, intemperance athil unw bolesonte articles of ford. It is some puncture ind aced by wninde or bores, or even by a slight puncturs or scratchor the skin is persons predisposed th arainst lay means of ventilation and cleanlinces in loos pitals. Thongh the proper seat of the inflamanation is the skin, it frequently extends to the parts onterneath Authors usually distinguish four kinds of this disease, the phlegmonous, citematons, gangrenons, and erratic The first of these is clatracterized by the greatest degreo of intlammation. In the cedematons, the inflammatory ymptoma are less intenee, but the tume faction is greater tutions, drupsical perseng, and thode who have beca long
subject to other chronic maladies. It is utteded with considerahte slanger whes it uffecto the fate, and oftel terminates fatally on the surenth or cighth day. Th

tion, or without eod only; forever; unchangeably ; in
 Cifer'mity, n. [f'r. éternite; Lat. eternitas.] Daration or out end; the state of tirue atter death.
(Phil.) An attribute of the Deity, the existence of
whom, according to the true principles of religion, is without heginaing or end. It is a begatice idea cluthed with a positive name. To whatever it is applied, it supposes in present existence, and it is the acgation or denial of any begtaning or eod to that self-sagat state of existence. As itpplied to the leity, it has not been controverted by those who acknowledge a deity at all. Un the comanon basis of argameutative philusuphy, there sever conld edly that state of mothiog impulpahle mist have necessarily have contimaed op to the present time. In etrictnesa, how cuer, we have nothing to do with duration priur to that of the visible world: it is sufticieat for us to knew that the contriver existed before bis handiwork. Eternity being infinite, is ineonceirable by our finite mbderstaadings ; at the sane time. We cannot imagine an infinite being to exist withont it. There is a distinction male between un anterior and n pnatertor eternity; ths latter belongs to beings whom Giod proposes to jreserve forever, the tormer to himself alone.
endless, to yerpetnate; to make Torever fameun ; to in endless, to perpetnate; to make forever famous; to imEtesian.

much funer aud rarer than air, which, acrording tumat philosophers, lerenms from the lanits of the atmosphere and occoples the heaventy space.
(Chem.) Ether is used as a generic turm to demote at series of organic bodies having the genemal formand Th $+_{1}(\mathrm{CuIn}+1,0$. They are hoked uphas being iterived from corresponding aicohols by the athitraction of one equivalent of water; or, in other wonds, they the regarded as the oxile of a riulical ropresented by the fre the hiydrated oxides. This theory has mudergonea moththe hydrated of late years, the followers of Gerlaritt laying it down as a principle that the equivalunt of an ether it down as a principle is double, and that its componuls whe formed by sulistitution. There are strung reatons in sapport of this theory, as will be sern when we consinir
the double and compound ethers. Ethers mre sulutivided the double and compound ethers. Lithers are snimbidet
into-1. Simple ethess, of which ordinary vinans ether into-1. Simple ethess, of which orlimary vinans ether
maty be taken as a typo ( $\left.\mathrm{C}_{4} 11 \mathrm{O}\right)$; 3, the double cthers which consist of two equivalenta of thifierent ethery
united, as the methyt-thylicether $\mathrm{C}_{2} \mathrm{H}_{3}\left(\mathrm{O}, \mathrm{C}_{4} \mathrm{Il}_{5} \mathrm{O}\right.$ : and the united, as the methyt-ethylicerther $\mathrm{CoH}_{3}\left(\mathrm{O}, \mathrm{C}_{4} \mathrm{H}_{5} \mathrm{O}\right.$ ) and the
componnat ethers, which contain inn equivalent of an ether onited to anl equisatent of mother is $\mathrm{C}_{4} \mathrm{IH}_{5} \mathrm{O}, \mathrm{KO} \mathrm{O}_{5}$ : hy drochloric ether, $\mathrm{C}_{4} \mathrm{H}_{5} \mathrm{Cl}$. From the formulie given if the donble mad consideral as dimble atoms of the originat ether, in which one atum is replacel by anther ether in one case, und liy an anhydrons atid or athatinn in to mean the ordimary sulphoricether, as it is improperly

What was called the satyric drama. To $E$ chiefly wa owing the introduction of the prologne, und the Dhus ex machina, or the practice of solving the ditticulties of the cont-mporary and rival of sophucles, and was wn of the sictims of the satire of A ristoplanes,
En'ripats. En'ripons, as narrow strit brparatiag the and reflox of its tide, contimine regolarly for the tlux days, and becoming stationary for the remainler of the month, was a matter of deepinquiry among the anciontio Enrac'iytion, $n$. [Gr.] A ioulent wiad, ancotioned in Ats axsit. The binue scems to signily a stormi from the cast; but the readings vary, greally, and among these variations occurs the Joris cipukidwv, in the Latin Culgate, euro-aquito, the north-east wind.
Eurepa. (Myth.) The daughter of Agenor and Tule-
phassa, and slster of Cadmus the funder of Ther Accurding to some legends, her birthphace wis ill life nicah. Thence she was catried aw,y by Zeds or Juphiter in the form of a white bull, and lecame by him, in Clete the mether of Minos, Rhadamanthis, und Eicts. Enrope, ( $y^{\prime}$ 'rōp, ) the nust jopthans, but, with the
excoption of Abstralasia, the shatleat of the divisions exceptson of Abstralasia, the smalleat of the dirisions
of the globe, boing atount a fifth part of tha size of Abia of the globe, being atbont a fifth part of the size of Abia or America, and a third part of that of Africa. $E$. is mestly sitnated within the temperate zone, and no part
of her surface approuches within many docrecs of the intertropical regions. The climate in therelore muther inclined to cold; but it is comparatively temperate and is neither socold in winter nor 60 hot in summer as the conotries in the correoponling latitndes of A siat and America, so that while cumfortable loilgiag aud inhatitontsing are cmainensible, the cexertions of the inhatitants are nut imperded by the too great intensity
of cold on the one hamd, or of beat on the uther. Thi eurfnce, too, of the conntry is infinitely varied and pic turesque, and it has the advantage of lieing arore inter sected than any other continent by great arms of the 6ef, supplying facilities to internal and forefon com merce that are all but wholly denied to A sia, Africh, and Anstralasia, and ouly enjoyed in an equat degree by Auterica. The goil of $E$. also seems the be of the quars of the surdandman: Fir though reward the ef so fertile as to prodnce crops without laborious diligence, and consequently does not foster indolence or a Want of attention, it oever fals liberally to reward
the efforts of the industrious and skilful cnltivator, the eftorts of the industrions and skiful cnltivator. -
Owing to its penmsotar conformation, the pregent Owing to its penmasular contormation, the pregell bhores form the irregular rim of the great basin of the North Atlantic; on the N. It lies along the Arcti- Ocenn; and on the $\mathbf{S}$. it is separated from Africa and Asia by the Mediterranean, the sea of Marmora, the Black Soa, and their connecting straits. Towards the E., on the other Ural Mountains may be regarded as furnishing a sort of Uatural lasrier, but they leave a considerable gap buth natural harrier, bit they lenve a considerable gap buth
towards the N , and the S . In the S , the river Unal is nonatly accepted as the line of demarcation, thongll the plain thrnagh which it flows is perfectly similar on hoth sides.-The four corners of $E$. are marked lyy the month of the Kura on the Arctic Ocean in the N.E., Int. $69^{\circ}$ N., lon. $65^{\circ}$ E.: by the Nerth Cape on the Arctic Ocean in
 and by Cape A slieron on the Caspian Ses on the R.E., St. Vincent in Portmeal to the Ural Manmeains near Ekaterintmrg has a length of 3.293 mb , and finds ite centre in the W. of Russian Poland. From the month of the Kara to the mondh of the Ural river the direct distance is $1,600 \mathrm{~m}$., luat the beundary line has a length of 2, to0 mb .-The tutal coast-line is ent. ht $19,820 \mathrm{~m}$., of which atont 3 , bur bermy to the Arctic Ocean, 8,396 to the At--The political div. of $E$. in 1882, with their nrmos and Wap, modihed by recent events, as the Franco-Prussan

ANDTHEMEDJTKRRANEANふEA.

Europe, the smallest of the great divisions of the globe, forms the north"estern portion of the Old World, and is properly only an extension of the continent of Asia. from which it is separated by the Ural Mountains and River, by the Crspian Sea, Caucasus Mountains, Black Sea, and Sea of Marmora. On the south, the Mediterranean Sea separates it from Africa. The continent extends through 35 degrees of latitude ( $36^{\circ}$ to $71^{\circ} 12^{\prime} \mathrm{N}$ ),
and through 75 degrees of Inmifule ( $9^{\circ} 30 \mathrm{~W}$, to $65^{\circ} 50^{\prime} \mathrm{E}$ ). Distance from Cape St. Vinceut to the 1 'ral Mhumtat:- 3.f!0 miles; firm North Cape to Cape Matapan, 2.430 milos. The atest is alnutt $\mathrm{r}^{\frac{1}{3}}$ of 11 at of the entire land surface of the glohe, anml it hat ant $\frac{1}{6}$ th of its If pulation. Scale of Map, 265 miles to an inch, one square inch comprising $83 \cdot 5$ tines the area represented by one square inch of Map of Ei gland.

\&b, and Portnguese, which are partly a corruption of the Latin; the German, Flemish, Uutch, Swellah. Dint ish, aud English, which proceet frint the Tentome; the Sclavonic, which predommates in the hagnage of $\mathrm{P}_{\mathrm{o}} \mathrm{o}$ Inun, Russia, Buhema, and a grent part of Turkey in Europe; the Celtic, of whach there aredalectson Wiles, Scothand, Ireland, the N.W. of Erance, and Laplant; the modern Grevk, and some othert. - - how Christime, with the exception of the Turks, and scattered senthements of Jews. The Christians in Furope arn compused of thete ereat bodies - the (iatholics, the l'rutestants, mall the Gireek Charch. - Hist. According to the mythotogy of the peets, Europe roceised its nithe from Europa, who was carried there by Juphter. Baclart therives thon name from the 1'hoenician uruppa, which hu makes equivilont to the Greck l-ukoprasopose, of a whit, or f.ir aspuct: and considers it as applying to the continent of $E$, from the fatirer visagis and complexions of its ithalitants. M. Gebelin, on the other h.mb, denlanes the word from the flat direction from Asian. The first inhabitantanit Europe came from Asia; nul during the phriod when luge aod powerfal empires flomarished in that quart of the globe, $E$ remained for a lenght of time pibnges t.ite, atd soon nttained a high degree of civilization at tho same time sprealias hot colonies over suntherif Italy, as well ins on the consts of G.anl imid siant. In the sth century b. c., Rome whs tomuled, ami, by de-
grees, connuered tho whole of ital, finaly extering her dominion over nearly all $E$., whith the exception of its more northern nations. Atter the fall of the Romats empire, the bartarians, coming for the most part from
Asia, overran $E$, and for nany ages after thom advent Asia, overran $E$. nad for nany aged after tharir adyent empire of the Visigoths was foroanl in spain, that of the Franks in Ganl, the Lombards in Italy, the Saxnns in the north of Germany, the Avari in the sinth, and, Britain. The Greek empire at Comstantimple, the onl remant of the Roman dommation, sulsisted, nererthe less, in eastern $E$ Ahout the yoar 860 A . D., the great
conqueror and ndmioistrator, Charlemagne, moulded. conqueror and admioistrator, Charlemagne, moulded. for a time, the pire, embracing the greater part of westurn $E: 11$ is ancof their sncestor had formed; and from the ruins his large possessions arose the separate kincloons Frabce, Gerosany, Italy, Lorraide, Provence, Burcuntly Fc. In the 10 ti century, the great nations of the Nurith came forth from their obscurity, and linssia, Sweden, Nurway, and Denmark took rank as linropean puwers,
at the s.ime time that the Moors, who hud invaded and held the fairest portions of the Spanish peginsmia, from the Sth centary till this periot, began to retiro before the Christian kiners of Lom, Castile, Aragon, and Portura At length, in the 1 ith contury, on the taking of Constantinople by the Turka, 1453 , all the great otates of 16th century the United Notherlamls detached themsclves from the Spawish cruwn, awd the Prussian momarchy was not formed until the 18 ith . The general w.ur which broke out on the French revolution of 1783 changed, for a time, the asyect of the contioent, Napoleon 1. being everywhere victorions. Atter the fall of his empire, the old oriler of things wits in a great measure re-established. The territurjeg of the various states, as fixed by the treati/s of $1 \times 15$, are thuse which
tow sutaist, with the exmeptions below nuted. In Is 27 Greece scharated from the Turkish etmpire. In 1831, the kingdom of the Netherlands was divided intu the king-
doms of Belginm and of Holland. In $\mathbf{1} 559$, with the doms of Belginm and of Holland. In 8859 , with the J.ombardy and in $1 \times 61$ the kingdom of Italy wars cull stituted. In 1864 the Danish prov. of Schleswig-11, 1 st-in berame ibliernan pros. By the treaty of Piacme 1866, Anstria ceded the Venetia to Inaly, and reeopnizen the German Confederation constituted under the dime
tion of Prussia. By the treaty of Jay 10 , 1nil, 1ranem tion of I'russia. By the treaty of May 10, 1nīl, Frame ceded Alsace und Lorraine to Germany, and the fatm
 $E$. sec Berain Thf ity, page :29i), and besudos ceded

Evaporate, r, n. [Fr. Croporr, Iat, eroporo, evapora. tus-e, ex, nud rapurr, from ruphr, steam, vapor. Sed
 or tuas off winlout effet ; turet; to exhate; to escap or pass off whiont effect ; to he dissiphated; to be whated dissipate in fumes, steam, or ainnte particles.
-a. Converted into vajor; evaparated.
Evayoraled, p, $u$. Converted into vapor or steam and disnpated; dissipated in insensible partucles, as a tlaid

Evajboráliont, $n$ [Fr. eraporation, from Lat. enapora tio. Act of evaproratimg; the conversion of a fluid into vapor: act of Hyint of in fumes; vent : discharge.
(Chem.) The conversion of liquid or solid lodius
(Chem.) The conversion of liquid or solid bodies inte elastic vapors or gasec, by metans of heat. E. groto on stowly or rapialo lly ardiog to ciremustances. Witer the surface of the clotio. It rises in the sir as nawor, and when conidensed by clapere of tomperature forms rain or dew, and descends again to the earth. When how ever, $E$ : takes place rapidly, as in the case of chullition, it is gencrally called ruporizalion. The cquantity of vapor which rises from the aurface of a liquid in the ofen nir nut only depenis upon the quantity of surface exposed, but also on the stite of the atmosjhere at the time. In warm and dry weather, both in winter anml summer, $E$. is greatest. It wis found liy Dr. Dalton that water rased to 2120 evapurated at the rate of 4244 grains per minute. Merenry dues not evaporate till it io raised
to $60^{\circ}$ or $80^{\circ}$. Below that temperature the sravity of the constituent atoms is greater than their elastic force In all liquids whose builing-puiots are hight the elastic force of the sapor is very small. The elastic firces of tho vapors of most solial bodies are so low that they cannet be ev.ipurated by the highest natural temperatares. The $\boldsymbol{E}$. of a lizuid is a couling procese to the liynid itself. This fact is make nse of in India in order to probluce jee, Water is expused is slantlow, nnghized, carthen vessels, restiug upon imperfectly coniucting substances, such as surar-canes, \&c. During the dry clear nights E. gieen on, and a thin lim of ice is formed. The cold produced liy the formution of vapor may easily be olserved by plac thermometer The mercurs will continuc tudescund a long the the $b^{\prime}$ lasts. It merenry is pinced in the receiver of an air-pump, tugethor withs sulphuret of curbou, when the nir is with leriwn, the cold probluced by the $E$. of the sulphoret of carbma is sufficient to freeze the mercmey Sun IIrin-metik, Mettorologr. Kun.

(Chm.) The menns loy
siting at a listance from thich crediturs of permons re without the transmission of muney or guode T his is effertell hy meatis of whot are known as Bille of Eixchatige. A Bill of Exchenge is manply an onder mideresed
 drawn, or to bis order. A merihatit in Sicw York owing a sun of money for goods to a merrlunt in l'aris, instend gues into the market and baye from another merclunt, who has a debtor ill Paris, a bill of exchance for tho Who has a debtur inf Paris, a bill of exchange for tho this w.ay ents pryaurnt of his delt from a permon in his own town, the dehtur of the sicund merehant. Bills of exchange are of two kinds, imland and forropn; inland when buth parties rusilc in the sume state or contrity sald furcign, when the drawer and drawee reside in countries fircign to each other. In thin respect the estates of the Einited States are held foreign as to cach other. In cities or tountries having consideraine intercourse together, the debta motually dine thy the one to tho other gencratly apprand an equanty, Butwewn what is knomn ns pur of $b$ which is the equivalumes of a certaio atmount of the currency of one country to the correney of the wther, the curreacies of both levin: 8 mposed to be of the precise waght and purity fixml by their respective minta. Amonk the canses that affect the par of E., in allition tu a rive or fall in the price of the precinus metaik, are (1) changes numfe by antlority in the quantity of pure metal coutained in the coin by Hhy of increase or dimidution: (2) depreciation from the use of paper monry; (3) clipping: ( $t$ ) wear snd of tho ather exactly to tho anomat that it sells, their of tho other "xactly to tho amonnt that it sells, their This, however, is rarely the cose ; for there is almust always a halance owing on he one nitle or the uther, hom this lustance affects the rate of $E$. Thus, if New York sutuls to Paris more goods than she receives from it, there will lee a greater drmand for bilh ypun Nuw
York in Pirin than of hillsupon Paris in Now York, and York in Parin than of hills upon Pariv in Now York, and their value will proportionally advance alnove par, while
in N . Jork, in like puthener, they will fall leelow it. It in N. York, in like pumner, they will fall leelow it. It
is evident, huwever, that these nnetuations in the real
E. are suliject to certain limits beyond which they cannot adsance. Thns the price of Linls of $E$. on any place ean never exceed the expense of sembing bmilion to that place, otherwise the merchant will find it to hie asluntage to transmit lnallied in place of bills. The tendency of any atvance in the rate of $E$. is to stimulate expurtation, and to check importation. - The term is also applied to the place where the merchants brukers, and bankers of a commercial city meet to trans Cel hasineso at cert:inh hours.

fion; expulsion; expatriation; anabandonment of one's country, or removal to a foreign country for residence the person banished or acparated from his conutry (Hist.) In Roman law, the punishment of banirhinterdiction from the vee of fire and water, pronounced is a sentence sgainst great offenders, compelling then to expatrinte themselves. It appears that the direct gentence of exile was not known to ancient Roman jurieprudence. (Cicero, at Herrno.) In modern Fruse (thefore the Revolution), there was a distinction between banishment and exile. The former was a punishment aesigned by the law, snd producing infamy; the latter the monarch (nsmally through lettres de cachet). Thus political uffenders were frequently exiled to their eapates, to a certain distance from court, \&e.
Sxilw, v, a. ['rr, (xiler.] To banish from a country or lome ; to drive nwiy, expel, or transport from one's
conntry; to drive from one's country by misfortno Exiledi', p. a. Bansished; expelled from one's country by unthority

the guidance of Moses. In Ilebrew it is termed le-alahshenoth (tbese are the names), from the words with which the book begins. E. may be divided intu two principal part6: 1. Historical (i. 1-xviii. 21), comprising the prejaration for the deliverance of Israul trom their bonlage in Egypt, and the accomplishnsent of that de liverance; sad 2 . Legislative (xix. 1-xl. 38). In the first section we have an account of the great increase of Jacob's posterity in the land of Fikypt, and their oppression nader the "king that knew not Joseph;" an acconnt of the birth, education, and flight of Muses ; turn to Erypt ; bis interviews with Hinrnob tise inflo tion of the ten placues, and the institution of the Pass over. Then fulluws a narrative of their departure from Egypt, the passage of the Red Ser, with the destruction of Yharaoh and his host in the midet of it ; the principal events on the journey from the Red sea to Mount Sinai; the bitter waters at Marnh, the quails, the binnna, the water from the rock at Rephidm: the limttle with the Amalekites, and the arrivil of Jethro with Moses' wife and children in the 1 rraclitish camp. In the second part of the book wo bave the promulgation of the law on Mc. Sinai, the preparation of the prople by Moees for the renewng of the covenapt with Gud, the promulga-
tion of the noral law, the judicinl law, and, lastly, the ceremonial law, inclading the construmen and crection of the tabernacle. In chays, xxxii.-xaxir. We have no acconat of the idelatry of the Jaraelites, the breaking of the two tables of the law, the divine chastisenment of the petple, and the renewal of the tallis of the covenant. This book comprises a history of the events that took place during the period of 145 yark, from the yunr of the world 2369 to 2514 inclusive, or from the death of Joseph to the erection of the tabernacle. Twenty-five passages, necording to Rivet, aro gnoted from $\boldsymbol{E}$. by Christ and hia apostles in express words, and ninetech allusions to the same are made in the $\mathrm{N} \cdot \boldsymbol{w}$ Testannent. Moses though thare huve ticen many learned critics Moses, though thare havo been many learned critice, both Jews and Christians, of a contrary upinion.

## EXQU

Expmindi', r. a. [Lat. erpmere, to lay or set ont.] T
setont; to explain the meaning of ; to clear of obscority Exponnal er, o. Ono who explains the meaming of
Express', と. a. [Fr., from Lat, expressus, pp. of exprimure, to press ont.] To set forth in words; to spuak, write, or engrave; to utter, declare, or assert; to exhilit by copy; to form a resemblance of; to indisat
-a. Clear; plain; direct; not ambignons ; intended for -n. A messengor or vehicle sent on a special occasion: the message or despatch sent; any regular conveyance of messages or despatches.
(Com.) In the U. States, the word is upplied to a aysparcels of any kind. This system was orisiontent in 1839 when Mr William F. llarnden, of Bostum, procesded to
New York in charge of a few parcels, bank-notes, de. New York in charge of a few parculs, bank-motes, \&c.,
for delivery in the latter city, and for which service he for delivery in the latter city, and for which st-rvice he
received an adequate remuneration. The success of this experiment led him to form a contract with the railroat nud steambont companies connecting the (wo cities, ly
which increased facilitice were affonded.him for tho development of his scheme. In the next year arival $A$ started under the auspices of Messrs. P. B. Burke nad Alvan Adaras, which evertually extented its ramifications throughout the U. States, and led the way for the formation of numerous other companias, ppecitied at the
foot of this artirle. The Burko and Admas $E$. hecatme consolidated, in 18it with nther companies, ent form the now celebrated "Adams' Express Company." There are now many other express companies, besides which some railroad companies have added the expressage of small
parcels to their freight departments. It is estimoted parcels to their freight departments. It is estimoted more partly, employed in the express businesk. One of its largest branches is the collection of bills on the delivery of goods, which has created an important division credit. Compared with the post-office, which carries mail matter at the risk of the owners, the express offere at least equally prompt deliveries, and. forther, guaran-
tees them; a company or firm assuming responsbility tees them ; a company or firm assuming responsibthity
for the packages intrusted to its care. Hence, the express is employed in preference to carry parksges of value. Witlt regard to the comparative cost of trans-
miseion, packages exceeding a certaia weibht capnot be bent as cheaply by post as by express. But for small parcels the postal clarge is much less than that of the express, and is the same for the whole country, while the express charges vary with the distance to which parcels are to be sent. The advantages of the post-office system are, however, offset in some degree by restrictions on low-rate mail matter, ench as requiring it to be sut in
wrappers "capable of easy inspection."
Expres'sage, $n$. The amonnt to be puid for any par-
Expres'sage,
Expres'sible, a. Capable of being squeezed out, or of
buiner uttered, represented, stated, or declared.
Expression, $n$. [Fr., from Lat. expressio.] Act of expressing; forcing out by pressure; exturting or elicitmental tone. - (Five Arts.) The represcatation of the various passion $=$ of the mind.
Expres'sioniess, $a$. Voil of expression
Exprevsioniess, $a$, , loid of expression,
Expres'vive.a. [Fr, expresif.] Serving to express,
utter, or represent; showiog with forcu; significant;
Expratesivively, adv. Io a manner distinct and clear
Expres'siveness, $n$. Power of representation by
Expreswiy, adv. Not by implication; plaidly; dis-
Cxpromis'sion, $n$. (Civil Lav,) A species of nova-
tion, as a creditor's acceptance of a new debtor, who lakis the place of the old debtor, who is relicved.
Expromisssor, $n$. (Civil Law.) One who
Expugn. (ex-pune',) v, a. [Lat. expugnure, to take ly
assant, fromex, and pugna, a batele, To take by as-
sanlt; to storm; to capture; to reduces to subdne.
Expngn'abile, a. Capable of being forced or cunquered.
Expmgnation, n, A taking by assanlt; conquest.
Eipnilwion. $n$. [Fr.. from Lat, expulsin, from expel-
lere, to drive out] Act of drivigg out; state of being
drived away, with. or without, violence.
Ex pani'sive, $a$. Fr. erpulsif. Having the power of
Expmie'tion, n. [Lat. expunctia.] Condition of being
ireed from errors.
Expannce, r. $a$. [Lat. expungere, to sting: to prick
Exproy; to reader invisible, or Exparate, r, $a$. [Lat. expurgare
to clean wat. $]$ To render clean; to purify ; to iree Ironi
Expurigation, n. [Fr., from Lat. expergntio.] A
cleansing out; a purification; a frecing from what is of-
fensive.
Expartsator, or Ex'pnrtator, n. One who
cxpuraraio'ríal, $\alpha$.
Expur'fatory, a, [Fr. expurgatrine] Cleansing: Ex'guisisite, freeing from anytling nosious, or erroheous carufully: choice; select; nice; exact: lighly fiaished

- Maturely considered; delicate; refined; matchless

Ex. A perann over-carefully drensed; $n$ fup, or dandy Vx'quisitunesu, n. Xicuty; accuracy; keenness of Exsunguin'ity, n. (Med.) Want of the due amonnt

 in the proper anount of blowl, or meming bloedlew, ws
a person aftur a coptuas henorrhage. Ex*at'arats, 1 a. | 1at. ex, intenisivo, and atur, full.]
 Eixnefudl. v.a. [lat, rascindere, to cat ofl.] Vo cut ull; disserijutural, $a$. Not to bo fount in the Blule, or Exsittelinte, $a$. (Zno.) Applied to an insect which bus t10 wsible si"ntellum, it benng wholly covered by the Exsection, n. (Lat. ersectio, from ex, und secare, to Eint.) A "uttmg out, or uth. (Lat, exsertus, from ex, and

Exwie'eate, An romedy usoul for drying up n soro.

Exvie'ention Jewell. Exsicemtlte, $a$. Tmuliniz to dry out
 charfe of shlavit a spittiag of phlerin from the lung
Exwifinlate, $a$. [Lat. ex, and stipula, a steth.] (Bot.)
Exvile'eons, $a$. [Lat. ex, and succus, juice.] Wanting
Exviletion. n. [Lat, exstuctio, from exsugere, to suck
Exsinda'tion, or Evidiation, $n$. [Lat. exsudatio.]

blowing out.) A ceremony in the rubric of the Cutholic
Charch, for exorvising perions possessed.
Cxtand', $a$. [Lat, cxians, from erstare, to stand ont.
Standug ont protrusled? actually in being ; now sob Eisting; as, "Ali his exfant works," - Johasum.
Extasy,
Lixintieat
Extennporaneous, $a$. [Lat. extemporaneus, from ex ing from the inpmulse of the moment or onpremeditat.d ing iroms the intpulse of the moment; uopremeditated
composed, performed, or uttered withont previons study
Extempera'neonwiy, ade. Withont previons stady Ax fempora'neonsnesw, $a$. Tho quality or facnity
Extemporarily, adv. Withont previons atudy, or
deliberatho.
[Lat. $1 x$, and temporariue.] Arising from the cirenastances; composcd, performed, or nttered withont preauditution.
Atenipore nde. [Lat.] In an extemporary manner unpremelitatedly; on the kpur of the moment.
"Tbe bahit of speaking extempore."-Btait.
-a. Unprimbitaterl; without jrevious reflection.
:xteaspore Npenhins. [Lat, , and temporaart of clemly and forcibly expressing one's ideas upon any sulbject withont previons preparation, at least as jurizel speech pre-snpposes a preliminary operation of theught. Before extetnporizing $n$ spuech, it is necessary to have the fimmition of the disoourse fixed on the mind, and the surcessinn of thoughts to be expressed.
Thera abould reign between all it parts an order of filiThere abould reien between all it parts an order of fili-
ation, or gegeration, the one idea nuturally producing the other: abit thry shonta bo no slikposed that each may be fonnd in the very place marked out for it, the
moment it is required. The great requisite in $E$. $S$, moment it is reguired. The great requisite in E. . . is
to hrwe clear and distinct ideme regarding the subject on whicth one is about to spopak. It areler to xpeak fircthly aud clearly, ous must begin liy foeltug vividly, and then clear inkse on the subject will naturally fillow. It
 may becone so completely aboorbed in the contempla
tion of hin suldeet, on to the rualle to enter npon it in notionjtiug to berombl geand nownkrss athl it fre quently orcurs with mens of genime. Ita, therefore whe Woulat speat will, minst forl what he han to say with sutliclout ntrength fo exprome it with warmen anivivac ity; bot has teviling thant nut uttain flat volotaruce which prevente the mind frots w-timg, athl paralyan'r the xpresoluh, from itw viry fulturn. in spowaking, tho feelings have to loc resolved hato bilean, thonghts, imagern and these into warde, phiresen, latoguage. The main Wean of the nuljuet has tole tirmly grieneed; ant in it
 intukers, ant thase into snlorilmate partx; wint no on
 it ought to the vudow ofl with grent quichnomen in the for mation and variation of its phitures, atad almon with grent clowrawes, In ordiet to problure, at Brat vifort, a well marked ifange, tho litura nom whtline deflewt with great xartoces, and the colors leright, me thet lamgung" lat ouly to ruproduce it unhesitatipgly and muranfuncilly In many men, eveo of talent, the imaginntion in no ufficiently roaly aint clear; it works too slowly, fiwing cather to a antural defochency, or, hore fremuritily, to a appearing in pisic is materain, the exciternot of appearing in public is su grent an to prodnce a certaic
 perfectly sinre of whit younare guing to bay, and to have lear conception of it. The pulilic npukier repuiren to
 onght tostudy logic, ninl the works uf the lowt nuthors ho ought, nlsis, to açuire such a buastery over lije uwi thought, as to be able to decompone it into ith parth, to analyze it mot, it elements, and then, at beed, to re-compose, re-gnthre, and roncentrate it again by a nyntheti
cal procens. Now, thid can he well done guly hy urit ing: and honce, one onght to begin by lomatne to write ing: and honce, one onght to hegin by loarning to write bedore he ventures tor njenk. In lemrning to write, und Writing gives wublerfol clemrnesk amill Intundty to hought. and enables as to look at a nulboct in exery ight. In the consideration of a kulject, the bent way fo first to selze holl! of the mnin inles, unt regard it intuntly for some time, the duffernt faculturs of thr mint concrintrating themselves ugon this single puint the rulject is thas thrned over in every dirmetion, and viewud in all its asperts; ita principal parta theo cume ont and gradually wr parate thrinselwen from enth other, beconning more utad nure developed, until they rene la their perfect form. The public apenker nhmuld have hic mind well stured with information on $n$ great vnrivty
of suljucts, more particularly such as are regarded as forming part of a liberal edncation: for we can extems porizo only what is alrendy in tho mind. It is of impore tance, too, that all wo know he ntrongly concepivel, firmly linked together, and carafally wronght ont in ench a way that, throughont all the diversity of knosl edge, the mind, so fir as may be, shall admit nothing save what it thoronghly comprelunds, or, at least, las nade its own, to a certain extent, by meditnthon. Far-
ther, in public nnaking, thonght han to lo cluthod in ther, in public "paking, thonght hak to loe cluthod in
language; and rome attention to this is likuwisc necesolanguage, fand rome attention to this in her wisc neceablo a dress an possible. For this purpose, one ought to cultivate assidnonsly that natural demirn of conmant nicating to uthers what he knowe. ant of making thim see things in the same light that he seen thom. Tha bitu sebses upon a thing more quickly, and concenver it more clearly, when ther is also present to the mint the
idea of communicating it to another: and thms. almo, a idea of commumicafing it tormother: and thme, alno, a
natural desire is fontered for public apeaking. In the natural desire is fontered for public rperking. In the
detaild of diction, nt the monnont of jublic rpeaking, areat decision is neecessary, in order to clothe the julean in proper words ns thay thy pust, nud, unidst many nakntable, to alow none but such as are propur to escape
from the lipe. The spoaker, howeser, ut first, onglit from the lips. The spowker, however, ut first, onglit he has begun a senture or an idea, he onght to so on daringly to the end, even though he may have to tako refige in some incorrectness of latghage, or sume unauthorized tura of expression. Fecision, and even rushness, nre necessary fur him who wonld make a goml
pultic apeakor. Finally, tho muderstanding which kees puldic apeaker. Finally, tho onderstanding which kees rightly, am conceives chearly, and tre beart which feels the words and the urado are most the words and the artiogervents mos in. ogoas to what
is to be expresed.
Extemporizatious, p. The net, or act of speaking withnt previons jreparation: providing with ansuitable tople, or matiermes, that which is immediately neces-

withont any sutalile prequnation ; to do muvthiog is a busty, off-hand manner; to speak io public without $r+a$. To do anything withont sufficient time, or proper Extem'porizer
Extemiporizer q. n. One who ppeakn withont pre Exifuil: c a [Litertenalerf to ntruteh ont.] Todraw out; to prolongt to protrict. - To externd; enlarge widho: dilate. - Tol lold forth; to reach out ; to tiestow v. $n$. Ti, reach: to he eontaiacd in lengeth or breadth. Extenal'edily, ato. In an extended or entargel manExtender, n. One who extends; that which stretches.

## EXTR

"Wbile bis exteriorn were fandtens, the beart was corrapt." Johne.
Exveriority, n. Outwardness; nuperflcios; surface.

 to rout ont : to wextmminate; to tako awny.
meve
Exfermizontion, $n$. Total dentrintion; ellmination
Exferiminative, $a$. That which destroys, wapels, or

Wixferiminator, $n$. One who destroys or expels,
Fixterminniory, $\alpha$. Thut leads to destroy
Cxerras, $n$. [Lat. ccormus, outsile.]. A pupil belonglng Exter'unf, a. Ontward; exterior; visible; npparcut: - Forergal not connected with the homo polity.-1lay fug an ontwarl upparnnce.
: © fernality, $n$. Kintence in space; "xterlority:

V: xterwions, $n$. [ $Y$ re, from I,at, estersion, $n$ wiplag ont.]

Exiine'tion, n. [Fr., from Lat. extinctio.] The act of quefichnig. or suffocating light or fire, - State of bein suppression: as, "The extinction of nations" - Rogers. Extime, n. (Bot.) Theouter coat of a pullen-grain, Gray Exfin'wisis, $v, a$. Lat, extingurre, to suppress or pu Kinin wish, $v$, a. Lat, exlengurre, to suppress or pp
out.] Tos dippress; to destroy. - To cloud; to obocure. Exfin'suishatble, $a$. That may be quenched or de Extin' ruisiler, $n$. One who puts out or extinguishes. A hollow cumeal instrument used to put ont the light Extin'muishment. $n$. Act of extinguishing or putting out, or quencling; extinction; suppressiou ; de
struction; abolition: nullification; struction; abolition; mullification;
or coming to as end; termination.
Extir'pabie, $a$. That may be extirpated or eradicated. Extir'palte, v, a. [Fr.extirper; Lat. extirpo, extirpatus;
ex, and sirpz, the lower part of the truak of a tree stuck, root: probally allied to STEM, q. v.] To pull or stuck. root; provally anfied by the roots; to root out; to eradicate; to de stroy totally; to exterminate; to cut out; to cnt off;
Extir patedi, $p, \alpha$. Plucked up by the roots; rooted
Ext; etadicated; totally destroyed.
Exilirpa'lion, $\pi$. [Fr.; L. Lat, extirpatia.] Act of ex tirpating or rooting out ; eradication; excision; wota
Exilir'pator, $n$. [Lath; Fr. extirpateur.] One who roots
Extir'patory, $a$. That roots ont or destroys
Extol, va.a. [Lat. eetollo-ex, and tollo, to lift or rais up, to raise, from the root tol, allied to Gr. tla $\overline{0}$. See Tol ke.tEE] lo lift out or up; to raise up; to elevate; to raise in words or enlogy; to exalt in commendition to praise ;
Ex'ton, in Penasylvania, a post-village of Chester co, Exaut 28 m . W. of Plailadelphia.
Extor'sive, $a$. Serving to extort; tending to draw
Extorsisely, ado
Extori', v. $a$. [Lat. extortus, from extmripue-ex, and tor quea, to turn, to twist. Sce Tontere.] To twist or wrench out ; to wrest away; to draw from hy force or compal lence or oppression; to exuct violently:
Exiort'ed, p. $\alpha$. Draws or wrumg from by compulsion Extor'ion, n. [H1, extorsion, from L. Lat. extortio. Act of extorting; act or practice of wresting auythin from a person liy force, duress, menaces, authonty, or by any indue exercise of power; illegal exaction or
compnision: oppression; rapacity; oppressive exaction Extor'tionary, $a$. P'ertaining to or implying extor
1;xtor'tloner, $n$. One who practises extortion.
Extor'tionaist, $n$. An extortioner
Vix'Ira. (Latt, contracted from exlera (parte beipg understoot), from exter, ontward, on the outside.] A Latin is usual or agreed upon, and often used in componition ss, ertru-jndicial.
a. Extraordinary ; excessive ; additional ; as, extra work, Sra pay, \&e.
Sumsething extraordionry ; additional; not included Extraet', e, $a_{\text {. }}$ [Lat. ertractus, (Culloq.)
Exiract', v. $a$. [Lit. estractux, from extreho-ex, and truho, to dr.ww. Seo Tancr.] To draw ont or forth; to draw from by any means or operation; to draw or bring
out ; to find out: to take ont or from; to take out or out ; to as a part ; to draw, write, or copy out.
Exiraid. $n$, That which is extracted or drawn from something ; a passago taken from a book; a quotation :
(M.c.) The name applied to preparations olitained in a varjuty of ways from vegetable sources. Sonutimes they consist of tho simple evaporated juices of the fresh phant, and at others of certain priaciples extracted from the fresh or dried plant by menns of a menstranm capable of disgolving them. They are turmed watery, alcoholic, neetons, or etherenl, necording to the mensiruum emplayed. The objoct is to preserve the principhes from main associntod with or dissoilyed in other porling y the plant. Thacy uro also thas more readily used in
making pilla, \&c. Componnd extracts are those which are prepured from several plats, und simplo extrocts Exou one only.
1:xirae'ilite, $a$. That may la extracted
I:xfrus'tisn, $n$. [Fir., from Lat. extraction] Act of ex atock or family; descent; Jineago; gencalosy ; origin; birth. \& (r, frome a mulutatice
(Math.) The apreration that hars for ita object the discosery of the number, or rimi, which, when multiphei
by itnelf a ntated mumber of tiones, wiolde a siven result

Exfrafior, $n$. He or that which extracts or drawn ont. tr nhe, trathtus, th give ur deliver Bp. Suo Tasmitov.] A giving mp or narrondor of: the thetwory, whier a
 juminhment.-Thin nurrember of jeraman by one tedernd
atate to another, on its denumd, pornuant to their fod-
eral constitution and laws. Treatiea exist between tbe U. States, and Enghad, France, Irussia, Austria, \&co for the mutual surrender of persons charged with mar
der, forgery, arson, or embezzlement Exiradus, $n$. (Arch.) See Anch
Extratiotial, $a$. (Law.) Same as Parapaerxal, q.v. Extra-foliaceous, $a$. [Lat. extra, withont, and folsum, a leat.] (Bot.) A way trom the legves, of inserted in a different phace from them.
Exiritméneons, $a$. [Lat. extra, and genus, a kind.]
Exira-judicial, a. LLat. extra, beyond, and judicium a judicial investigation: Fr. extrujudiciaire.] (Lato.) Not belonging to the judze or to his jurisdiction, notWithstanding, which le takes cuguzance of it.
EXIra-mun dane, ado. Nomexira-judicial manner Exiritmann dane, $a$. [Lat, extro, mDd muиdazus, from murdus, the world, sue Moxdane.] Beyond the
Extri-mu'ral
murus, a wall.] Without or beyond the walls, from fortified city.
Exaraneons, $a$. [Lat. extraneus, fromextra, withont, beyond. Forengn; not belonging to a thing; existing
Extra'neously, ad in
Extraor ilinaries, $n$. pl. Things which exceed the Exiranr'diuarily thoid
Exiraordinarily, ads. In an extranrdinary manner; uncomponly; remarkably; ueusually ; partics-
Extrabrilinary, a. [Fr. extrandinaire; Lat. extraBeyoud that which is ordinary or wsial ; beyond or ont of the common order or method; not in the nsunl, customary, or regular course ; pnusual ; nnwouted; exceeding the common degree or measure; remarkable; unconmon; emineut ; rare; wudderfal ; speciar : particular. Exfrav'agnace, or Exthavagancy, n, [Fr., from Lat. extra, and ragans, from rago, to wander. See Vagaboxd.] A waodering beyond bounds or limits; a going beyond the limits of strict truth or prolability; excess of affection, paskion, or appetito; any excess or wandering from prescribed limits or bounds of moderation; willness; irregalarity; excess; prodigality; profuoion; Exiras'asenin, a. [Fr., from Lat.extra, out
ragus, wanderingl Exceeding due loundra, outside, and ragmodernte; nirtstrained ; ancontrolled, wild; exces sive. - Profuse in expense ; prodignl ; wastefnl.
Exfrav'asant. 刀. One confined to no getaeral rule
Exiray'ayantiy, ude. In an immoderate, wild, or
Extras'aganfaews, $\pi$. Excess; extravagance; im-
Exirievagran'za, $n$. [It.] (Mus.) A kind of wild, in-
coherent music, (Lit) A play
(Lit.) A play composed regardless of rules, and generilly of the burluogue kind.
vessel. To cuube tho blood to flow ont of its proper re-
 which are out of their proper wessels or receptacies. Thus, an $E$, of blood tikus place wheu an artery or vein is injured, and the litood escapes into the cellinlar membrane; ond an $E$. of urine, when, in consequence of a Found or ulceration. that fluid makes its way into the ia distinguishel from exudntion, in that in the risce. $E$. case, the walls of the vessele remain cutire, ind the fluids escape liy secretion. It is nemrly s) noms mons aith effusion, but is nut so, cumprehensive the disesloraeffision, but is nut su comprehensive. The distrderablood intu the cellmhar tissue muler the okin, from the rupturo of small blowd-sessels. When the ruptured vessel is large, or sitnated in a delieate part of the lrody, as in that brain, $k^{2}$. is usnally fatal.

## EZRA

tion as in man, differs from it in several points, more or less ienportant, so as to meet the peculiar wasts of the animal. So the eyes of the cat, the owl, and of noctorna enimals generally, are eomewhat different from those of such animals as seek their prey hy daylight; ado
these have special peculiarities, as is the eagle, who has a membrane to protect the organ from the ana when he looks upwards. The eye of the fisb is again difere and the density alapt it to the modinan it is accustomed and the density oi the water in which it is accustomed to resife. Sucu fish hs keep on the surface of the water oge-half being adapted to the mediun of the air, and the lower half for the denser one of water. The eye, according to the requirsmeats of the animal, is either places in front, as in man, or more or leas to the side and backWards, as the liahits or nature of the animal demand. In the more timid and fugitive, where instant cscape frem danger demands instant and far-off knowledge, the eye is large, prominent, that the snimal canwithout the movernent of the head, see behind as well as in front nad oideways. The best examples of this peculiar ble conetruction is found in the hare, and the eye of the girsffe (Fig. 982 ),
 which, it will
bole, or perforation, to receive a lace, snall rope, or cord.
Eye'lid, $n$. The cover of the eye; that portion of mov Gble skiu with which at animal covers or uecovere the eyeball at pleasure
Eye'plieee, $n$. (Optics.) As eye-piece, or power, as it Ia sometimea called, is the leva or combination of lenses
used in enicroscopea or telescopes to examiee the aërial image formed at the focus of the object-glass. The or diasry eyc-piece is a combination, and may le either positure or negative. The former conaists of two planeconvex lenses, with their convex sides towards each other; and 18 need for micrometers. The nemative, or Inygenian, corsists of the eathe lenses with the conve sides turued away from the eye. Besides these there ar in use, for observations of the snn, a diagonal eye-prece in whicu a very somall percestage of the bun's firm the best being transmitted. and Dawes' solar eye prece in which the light is redaced by olserving ouly an es tremely minnte portion of the solar surfoce. Steinheil and Kellaer have also centrived eye-pieces; they, haw ever, are not in such general use. The eye-piece of pera-chasses consists of a combination of bi-concave enses - as arrangement which is almost ont of date as applied to telescopes, althongh eccasionally it many be used with advastage. - All these eye-pieces, except the last-mentioned, invert. The terrestrial or evecting eyepiece is a combination of four lenses, used for terrestrial telescopes.
Eye'sallve, ( $-s a \check{a}$, ) nt. Ointment for the eye.
Eye'service, $n$. Service performed only under the in-
spection or the eye of an employer.
Eye'sirlht, The airht of the ese view ; Colambiaco the bense of seeing.
Eye'sore, $n$. Something offensive to the eye or sight. Lye'-torith, $n$. A tooth under the eye; a poioted tooth in the upper jaw dext to the grinders, called also is camine tooth; is fang.
Eye-water, $n_{+}$A medicated water for the eyes. Eye'-uitness, $n$. One who sees a thing done; one who has ocular view of anything.
Eylait. ( $\mathrm{z}^{\prime}$ lou, ) in town of Prussia, on the Paemar, 20 m forted the Russian was commenced by Augereau, whose division was defeated with immense alaughter; but Napoleen coming to the rescue, the fortanes of the day were retrieved, sad the allies compelled to retire to königsherg. The loss of life was unusnally great, though, from the die crepascy in the reporte, it is difticult to arrive at a pos
itive computation.
Eyre, $n$. [0. Fr, from Lat. ire, to go.] (O. Eng. Law A journey or circuit ; a court of jetieerant justicts.
Eyry, or Eyrie, (i're,) $n$. [Teut. ey, nn egg. See Aerir
An eggery; a nest for eggs; the place where birda of
prey construct their nests aod hatch; an aerio
Une of the canonical books of the Old Testament It named after its author, $E$, who was carried cuptive to Babylon by Nehuchadnezzar, n. c. 598 , and placed by the river Chebar. He prophesied for 20 yearz, it c. 595 to 575 , till the 14th year atter the final captivity of Jeru-
salem. The Book of $E$. abounds with sublime visions of the divine glory, and awfal denunciations against lsrael for their rebellions spirit against God, and their two equal parts: the first contaieing oracles before the fall of Jerusalem; the Becond, oracies after that event - the catastrople in question formiog the centre and culminating point of the book. In the first part we have an account of Ezekiel's call to the prophetic effice; circum-tantial announcement of the deatruction coming apon Judah and Jerusalem, on acconnt of the wicked ness of the people: visions and prophetic discourses re latimg to the rejection of the covebadt people, with a descriptiun of the guilt of the people, their ralers, priests, and false prophets, and several discourses reproving the idolatry of the people, and proclaiming the destruction prophacies against the pmponites Noabites Elomites and Philistiees. against Tyre, Sidun, and Epypt; re spectung the restoration of the theocracy, the future salvation of 1srael, in its couditions ond basis, and in its development, from the resuimation of the people to their victory over all the enemies of the divise kingdom; and, fioally, the renewal and glorification of the theoc racy in the Messianic period. There are so few ground for donbting the genuineness of this book, that its an thenticity has heen very little called io question.
Ez'ra. sue of Seraialh, a priest of the Jews, and a descendant of Aaren. Ife was carried captive to Babylon by Nebuchadoczzar. Artaxerxes Longimanis, however, and all the sacred vessels and ornamenta of the temple which he bad in charge to rebuild. On bis arrival at Jerusalem, $458 \mathrm{~B} . \mathrm{c}$., he set abeut the reformation of abuses, particularly ene of etrange marriages. He re stored the whole canen of the Old Testament. There is in the Bille a book under hia aame. and in the A pocryphat two others. Josephus saye that he died at Jerasalem; hut others assert that be returned and esded his

## days in Persia

Ezra, (Book of.) (Script.) One of the canonical book of the Old Testanient. It is generally attributel, both hy Jews and Cliristiana, to the priest whose name it bears; chiefly ziace, in ch. 8 and 9 , the actions of $E$. are rclated from the clese of the Book of Chronicles: riving an ac count of the return of the Jewe from the time of Cyrus with as acceunt of his owa subseqnent proceedincs. Th evente narrated in the book ocenpy a period ef abent 79 years (b.c. $536-457$ ). It contains the edict of Cyrus. $\mu \mathrm{er}$ mitting the Jews to return ioto Judea and rebuild the temple, with an acconot of the people who first retorned uoder the leadership of Zernbbabel, and of their offer ing toward rebuilding the temple; the commeacement of the building; the hiederances frow the Samaritans; the finishiog sad dedication of the temple in the sixth year of Darias ify masus, with an aceount of bis componions, and arrival at Jernkalem + and finall5, a parrative of the reforma tion effected by him. There are twe npocryphal hook of that name (see Esphas), and the Boek of Nehemiab is sumetimes called the Neomd Book of E., the two having been at ons time connected together

## ENGR <br> SUPPLEMENT

Electric Lishting. Recent improvements have beet chinfly in development of the various systems,
rather than in striking novelties. The arc-lamp, so termed becsuse the light is produced by a vivid blaze which plays is the form of an arc of a circle betweed
the tips of two sticks of carbon, is gaining ground as an out-door illnmmator or for large interior spaces, aod the incandescent lamp, so called hecause the light is prodnced by the incandescence of a filament of carbon,
in bonse lighting. Experiment are also beigg made with the use of the electric ligbt on vegetable growth,
and, it is clamed, with some success.
Electrie Railiways. The success of the first,
erected at Berlin, aud subsequently others in Paris, erected at Berlin, aud subseguently others in Paris, in Germans, prove the practicability of this manoer of propulsiob. The electric current at Beriu, and at rately suspended conductors; at Licliterfelde the rails were otilized for this purpose. Ia Paris, the cars are propelled by Faures accumalator, $\begin{aligned} & \text { Furoished by the } \\ & \text { Freuch Electrical Puwer Storage Compady, first em- }\end{aligned}$ ployed in $1 \times 53$. sble vighance to keep abreant with the wonderful dis coveries and irupruved applicntions of this force. We
can but touch briefly upou sume of the latest and most important. The ntirage of elrctrical euergy io of forewost Thalue. The possibility of thas depends upon the fat reversible. It is known that a dyoamo machine may reversible. It is kouwn that a dyoamo machine may be employed to generate a current. In this case, mebe used is producing mechavical power when a current is made to circulate in the cuils of its armature. The In an electric battery, after the zinc has combined with the oxygen of the liquid, it can be recovered from its
solntian and again deposited in the metallic form, $\theta 0 \mathrm{ab}$ to be agailu uvailable as a source of energy. To recover
this fuel, it is but nccessary to send a current of electricity through the battery in the opposite divectron.
when all the operations of the battery will be reversed. In brief, this id the basis of the plan of storage. Al for II. Planté to discover a juractical form of cell for atil iziug this secondary current. He obtsined his best resulphuric ach. Such a cell cao furnish no current, as there is no chemical affinity betweeo the plates until it has been charged by means of a curvedr. When composed. From this brief knd very geaeral description, it will be observed that it is not scientifically
correct to say that the electricity is etored, but that correct to say thast the electricity is etored, but that
the electrical energy of the current is converted into the electrical energy of the current is converted into trical torce when desired. M. Faure, io $18<0$, improving upon the experimente of M. Platé, prodnced a cell capalite of economical nse. Ne was followed by others Mr. Brash, Mr. 11. Sutton, ind others.
Elisis, (igotage, the literary name assumed by Marian C. nent of English novelists, Be, in Warwickahire, 1830 , D (3ry. J. W. Causs) Dec. 22, 1880 . She early manifested literary powers of high order, and soon after her début in the worlib of letters became joint-editor ot the "West-
minater Review." In 1857 elio started npon her brilliant career as a writer of fiction by the publication of Scenes unknown anthor with a wide-spread celebrity. In the following year Adom Bode uppeared, the succers of which wis extramrdimediction) and silus Marner on work but little interior to its predecessor. Food, aith the British Museum, wis placed at the head of an exploring party and ontroated with the charge of briaging to light such remaios of the haried city as might be diecovera ble. In May, 1803, the excavating in search of the Templa of Dasua was begun. Among the rebusias laid open in succession were those of the gymnasiom sod the forum, and a column was fonsd with an inscription iudicative of the glory of Ephesus as the chef city of Asia Hinor. Iu April, 1864, work was begun in seeking the Odeum - the grest theatre - sud its remains ware exposed togather with what remained of the tomb of St. Luke, coosisting of a part of a doorwsy, ob the jamb heing the amblom of the apostle. The Odenm was Fuond to be about 490 ft . in diameter, with a seating cupacity of about 24,500 people, and was undoubtedis the Isrgest theatre in Asia Minor. The orchestra is 100 ft . in diameter, while the proscenium, twe storias in height, is built in the most massive manner, the second tier being supported by numerous colamne of pare narble. In tha theatre were found six llock covered with inseriptions, portions of which denoted that they were taken from the Temple of Diana. Besides these discoveries, many tumbs of the early Ciristians, enclosing sarcopbagi of skeletons were exposed to view. In May, 186s, the work was reolmmed, and wall were broucht to light. Finally on the 31st Dec 1869 they struck the foundation of the great Temple of Diama. This foundation belonged to the earlicst temple (the ons burat by Erostratos), and consisted of two courses, the first of limestone and the second of marble, each coursa 2 ft . it thickness, and the whole reating on zolid masonry. On the 1tth Sept., 1871, a portion of the frieze of the temple was unearthed,
sion was composed of Nathan Clifford, Associate Justice Supreme Court, Firat Circuit ; Wilham strong. Third Circuit Samuel F. Miner, Eighth Cremit: Stephen J Senators Georga F. Edmands, Oliver P Murton, Freder ick T. Frelinghuysen, Alleo G. Thurnan Thomas $\boldsymbol{F}$ Baysid. Rupreeentativen Henry B. Paybe, Eppa Inaton, Josiah G. Abbott, James A. Garield, George F. lloar The vote in the Commission apon the Florida, Lonisiana, asd South Carolina count was: For the Llayes electors-Mesprs. Bradley, Edmunds, Frelinghuysen Garfield, Noar, Miller, Mortun, Strong, 8 ; for the Til den electors-Nessrs. Abhott, Bayard, Clifford, Fielo, Hnatun, 1'ayne, Thurman, 7, which practically gave the tecoision to Mr. Hayes. This regult was reached March 2. The voto in the Electoral Collego was 52

## EVEL

ogether with a portion of the westers wall, add nomerous debris of Antiphyxa, as the sculptured stones coverigg the marble tiles of the temple wers called. and a portion of the thick white marble parement burut by krostatus was found; also large marble blocks grooved for the binging of the doors. The doors themgelves were found to be about 15 ft . wide. Murs of the frieze was discovered on which were cat lions' beade, which measured atout 2 ft . across the furehead. Nearly all of the sculpture found showed traces of color. red being the prevailing shade. In the cellar Mr. Wood found remsius of the great altar of the last temple but two, and. proceeding in his researches, he arrived at the following reaults:- The temple was hailt in the most ebduring masuer on a rered stone, over which was putty-like sulistnace resembliog woul, over this again was mure charcoal on top of which the walls were built. Two columns were found in position, ope ou the euter and the other on the inner row of peristyle, -and by these and the steps Mr. Wood was enabled to lay uut a correct plan of the edifice. There were 100 columus is the periatyle, of which 36 were columbar coelætea, or sculptured columns. The idtercolumnæ in front of the edifice were narrowed in regular propurtiona - the two outer obee measuring 19 ft . 4 ib., snd the centre 2 s ft . The columbe Wereabt. $571 / 2 \mathrm{ft}$, io height and $61 / 2 \mathrm{ft}$ io diameter, fluted. The fictioge were elliptical, not vertical. Back of the the work of Praxiteles. Mr. Wood came to the concluaion that the temple had been open to the sky and that the statue of the goddess w'as shielded by a canopy As illuatrative of the magnificence of the decoration s fillet of gold was found between the layers of one of the columbe. This splendor of ornamebt, joined to its faultlesss arcbitecture, rendered the Temple of Diana ons of the seven wouders of the world. - The excaratione were closed on the 25th March, 1844, Mr. Wood leaving behiod him certain marked outlinen which might enable the work of investigation to be resumed at any future time, if desirable
ECly it, Jonn, an English author, B. in Surrey, 1600. After serving with distinction in the Royatial army a Commissioner of the Boarl of Trade and one of the earliest foundera of the Royal Society: llis best known worke are Sylva, a Discourse on Fureat Trees (1664), and his celebrated Diary, which contains invaluable information concerning the manners and society of the times he lived in. It has passed through many editions, the last one appearing in 1870-1. D. 1706.

Hayes and Wheeler, 185; Tilden end IIendricks, 184 and thas was settled a question which, in nlmobt any other country but the United States, uight have re
sulted in civil war and anarchy.

Fr. fíe; Ger. fer; Sp. faddi; It. füla, probably from lat. fotum, a prophetic declaration. from fa, rout of obsolete fir, fatus, to speak. Io $\mathbf{O}$. Fr., jar féerie signifies fittilly. Pers. pori, a fairy.] A fay; an imag inary being or spirit, supposed to assume a finnan form dance in meadows, steal infant6, and play a variety of pranks; an enchantrese.
(. Nyth.) In the traditional mythology of the nations of Western Europe, fairies (the elves of the Anglo-Saxone see ELF) were gencrally telieved to be a kind of intermediate beings, partaking both of the nature of men of the power of making themselves in yisilule, and of passing tbrough aus sort of eaclosure. They were re markably small in stature, with fair complexuons, and generally clothed in green. Their haunte were beliered to be proves, verdant meadows, and the blopes of bille, and their great diversion dancing hand-in-hond io a circle, as mentioned in Nidsummer Night': Drean. The traces of their tioy feet are supposed to remain visible in the grass long itterwards, and are called Fairy Ring or Cireles, (q. v.) They were regarded as being some times benevolent, nad sometimes nischievons. The diseases of cattle were frequently attributed to their mischievons oporations; ond cattle that died suddealy, elf-shot. They were said to be very fond of young children, ant were in the habit of carrying uway such as they could lay hold of, and leave vixens of their own in their room. In Poole's Parnarsus are given the names of the fuiry court: "Oberon, the emperor: Mab the empress; Perriwiggin, Perrivinkle, Puch, II bgob lin, Tomalin, Tom Thumb, courtiers; Hop, Mop, Drop, Jip, Drip, Stip, Tub, Tib, Tick, Pink, Pin, Quick, Gill, Ion, Tit, Wap. Wim, Nit, the muids of honor: Aynuphidia the mother of the maide." Croker, in his Fairy Legends und Traditions of the South of Irvlaned. describess thena as beings "a few inches high, airy, and almost traneparent they chance to dapee on it trembles indeed brenks. Both sexes are of extrnordinary beanty, nnd mortal beings cannot be compared to thern." They live in large sorieties, and are governed by a gueen- and the peasantry never speak of them lat with cantion and respect, as the good people and frionds, believing them to be present, and to hear what is said. They have their dwellings io clefts of rocks, caves, and ancient tumnili, ind every part of them is decorated in the most eplendid and gorgcous manber. The pupular belief ic fairies may teenad to have generally died out: but to it we are indebted for a class of literature which, to the yomg at lcast, has its censelens charms, - The hary ing like it amoure the idolatries of the beuthen raferm to in Scripture. In classical mytholocy, there is nothing nearer to it than the nymplt of the fountam or grove among the Greeks, The true fairy tules first becume popular in the latter part of the 1 ith eentury, and the Itatians nppeer to have been the first to tuke the lead. They afterward bocimo very peppular in France: and, at the present, they are more extensive and pogular in Germany than in any other country.

$-n$. Indentation, as oppused to prominence; often with in.

The various promivences and fallings in of the features." Addison.
Fall'ing lamae. (Naul.) A lerm applied to the timbers or upper parts of the sides of a ship when they
curve inwards. The old class of ships full home nuch more thas the modern ooes, which approach more neverly to being wall-sided. Yall'ing River, in ITrginia, enters the Staunton or Vall'izu-Nick'mesw, $n$, (Mrd.) A ilsease in which the pattent is, without warning, deprived at once of bla senses and falls down; Epilepsi, $q$.

## Ho bath the falling.sicknesr." - Siaks.

Falling Stars, n. pl. Evanescent meteors which dart across the sky it ell directions at night, vanishing after a flight of short durntion, dhring which they seem to
drak a brilliunt trainuf light twehind them. To the ol server they resemble stars sublenly falling from their positions in the leaveras, whence the name $F$.S. They generally uppour singly, lnat sometimes in great nimb bers, resembting a shawer of fire. During ontinury nights the number of $E, N$ olserved in an honr's time in from tos; butht two perfors of the yeni, thoor the 1umber or the sherally mash moris brilliant than that in Ang., and at intervals of about 33 years it is of extruordinary interent and splemior. Ka mankahle showers were olserved on the 12th of Nov, 17: had 1s:s3, and on the 13 th of Nov. 1 bist, - that of $1 \times 33$ equot ially, being the mast naggniticent of uny on recort The $F, N$ of tho Nov, showers wenerally ruliute in all

Fall of INodies. Thimotiun of any body projecting through the aur in a horizontal or obliquo divection and the path it describes, are considered under the hewi of Projectiles, $(q, v$.$) In this article we ghall examine the$
rateol motion of a body moving toward or from the earth in a vertical lino. The effoct of gravity is to uniformily acceleratu the motion of a bedy mosing totbent the centre uf the earth, and to uniformy dinimish that of a Body mosing upward, or from the centre of the earth By experiments with ATiwod's Mscanse ( $q$. v.) it has
been shown that the rate per second at which bodier acquire velucity if moving downward, or lost velocity falliug loody, in is second of time, is called the mensare the accelerating firce. Therefore, if a body be drupp $321 / 6$ feet at the end of tac first $6 \times c o a d, 6 t^{\prime}$; fect it th end of the next second, 96$)^{2}$ f eet at the enis of the thard of its fall may be fonod by muitaplyios the reloctty the end of the first second, or the mensure of the necd erating force, by the number of seconds daring whirit has been falling. The velocity of a boly at any period of its fall being known, the diktance it has fallen maty be found by multiplyiug the velocity at that period, liy
the number of serands it has been falling, and dividing the restilt by 2 Thus if i body luis been falling 5 se $3: 1 / a \times 5=1600_{6}^{5}$ feet per eecoud, and the space throngh which it has fallen will be $160 \frac{5}{6} \times 5 \div 2=402_{7}^{1}$, feet. If, instend of talling from a state of rest, a body he impelled dowoward with a given velocity, its velority at
any perimd in its conrse will be foumi by ueding the rate of mution it would hatve attained by the action of Grasity alone, to the initial relucity imparted to it. thrown duwnward with an initial selocity of 50 feet pur second, its rate of motion at the end of the fifth second which it would have fallen would be $50 \times 5+402$, $=65 \frac{1}{12}$ feet. If a body be thrown upward into the air, its velocity will diminsh at the rate of $321 / 6$ feet pe s eond nutil the firce with wbich it was prophlled np Ward is connteractet and destroyed by the action of gravity, which acts upoli it us a constantiy retaron an instant and then descend, increasing in velocity at the same rate as a body allowed to tall trom the same height or sulstance, fall with equal rapidity when uninupeded or substance, fall with equar rapidity when animpedicd ing buen fonnd by experiment to be owing entirely
the action of the nir npos them.

FANT
a comparatively mild and harmless form: but some- F'ancy-free, a. With the heart or inagination intimos it manitests itsulf in utrucitice of the must cruel and heart-renduar description,- murders, Assas-imations, and the moke. more is it the mother of fanuticism: mul the only fit cure for delasions of this surt is the spread of eduration, enathing people to judge righty as to the relative importance of thimgs, and to distingush betweed
the truc and the lialse. In a manner governed by witd and anreasonable enthosiasm; with wald, irrational
zenl or finarticism.
Fanaf'ieah ancss, $n$. State of being fanatic : fabaticism.
Fonatiedivni, $n$. Quality of a fanatio: wild and ex-
travagant motions of religion; excessive and erratic ens-
thusiasm: religions frewzy.
Fanafieize, v, a. To render fanatic.

F'aneied!. (fen'sid,) p. $a$. lanagined; imagmary; con-
ceived; hked.
Fan'eier, $n$. Oae who fancies, or takeg fancy
Fan'eifni, a. Full of fancy; cuided by the imaginatimu rather than by jndgment, reasen, nad expurience. whimsical; fantastical; as, a fanciful thata-Dictatel
tyy facy or the imagination; climerical; full of wild
1uageas, ideal; as, a funciful project
FancifnHy, ade. Inafanciful watoner; chimericnlly
wildy: whibsically
Fan'eifulness, $n$. Quality of being fanciful ; habit
Fan'eilesw. $a$. Destitute of faucy: prosarc ; bare of
Fan'erieket, $n$. (Znï.) The MuLn-canket, $\%$.
Frn'eg. n. [id, and Lat. phoultessia, from tir, phetinos, appearance presented to the miad: image; comeption: representation of anythiag formed in the mind. - The faculty by which the mind forms images or representations of thions nt pleasure; innagitation
-An opition or notion bred rather hy the inamiontion than by the reason; caprice; dusultory ieleat: whitu
-Inclination: eapricions likiog; fonduess; the, to take foncy to a person; - hence, by implication. the olject
of such inclination; as, the youmger sister is ny fancy. His fancy lay extremely to travelitag. - L Estrange. -Something that pleases or entertaids without much real use or value.

Loodon prike is a pretty fancy for borders. - anortemer. (Phil.) This term was used by the ancient philosophers as co-cxtensive with ennception-that power or
facnulty of the mind lay which man reproducrs the jmages of oljects, ap,urt froun any impressinn on the orgatis of sense. It in orw properly applied to a particular province of the imaciuation, thongh sometimes it is loosely
used as bymungons with it. "The office of the fancy," used as symunymons with it. "The office of the fancy,"
accordiag to a movern philosopber, "is to collett mataccordiag to a aolern philosopber, "is to collert min-
terials fire the inagination." A man whose hatits il terials fur the inagination. a present to him a number of risctabling or analggous ideas, for ilficy , but for an cffint of imariject, we call a man of fancy; but for an effant of imacithuse of taste and jadgment. - It is the power of $F$ which supplies the poet with metaphorieal langaag", and with all the analogies which are the foundation of his allusions; but it is the power of imagination that creates the complex scenes he descrilies, and the fic-
titions characters lon d-lioeates. To $F$. we apply the epithets of rach or lururitat; to imagination, those of beoufiful or sublimg. Others, however, regard F. is a hagher ecerge of einaufination that farnishes the mate rials ont of whech it creates its fonlavies, et ther by modifying or exagreratiug them, or by formiag new coakbinations. The Furicy, a term applied in Enpland to those persons, collectively, whe exhibit a sperial thate ur fancy particularly applied to those who encourage and proc tise boxing, or the art of self-defence
Fan'cy, r. n. To imazine; to picture or ficure to one self: to believe or come to a conclusion without prood
as, to fancy another is one's conemy.
r. $a$. To purtray in the mind: to form
c. a. To purtray in the mind; to form a conception of He 1 uscy but can ne'er
xpress." - Dryden.
-To fiel a fancy or inclination for: to be pleased with, particularly on aci ount of exteroal gifts or ar
be prepussessed in favor of; as, to foncy a girl.
Fan'es, $a$. Fine: clegant: ormamental: alapted t please the taste or fincy ; as, a fitacy contume
Fincy ball, a ball in entertainm,nt of dincing. it Which those who inttond are attired in fancy dresses: namonts for personal wear, uf lively crolors, as distin guished from artictes of a plaitier claracter and mos Bumbre bue. - Foncy atorks.  Na're. a vi
'ra'ros, (or PuAlan日.) nf. (Games.) A gamo of chance at Eryptian king Pharaoh, which was firmerly ujou one of the cards. It may be played joy any mamber of persuns, who sit at a tible generally covered with a green clush. The kewper of the talle is called the buenker. The phyyer is called the punter (from It. puntare), who receives a lirrot or small book from which to choose hif cards, upon which he buay at his option set any namber
of stakes, which are limited in amount in accordance of stakus, which are limited in anount in accordance with the capitat of the banker. The latter turns up first to his rimht fur the pack, one by one, hying this. tho puoter cor player), till all tho cards are dealt out Tho pobter (or player), till all tho cards are dealt ont. The batnker wins when the card equal in prints to that On which the stake is bot torns up at his right hatil,
hat fuses when it is deall to the Jeff. J'he player luses half his htake when his card comes ont twice in the sume stroke. The last card but one, the chance of which the lunker claims, but which is now freguently given up, is calloll lacty (a certahty). The hast card neither wins nor loses. Where a puntir gains, he pany either take lid money or purnfi ; that is to siy. donble his chance hy venturiog luith his etake and gatus, which ho intimates by bending a corber of his card upward. If he Whis agan, he may play spt et le ra, which means that benuling hiscurd a secould time. Should be aguis be sucbending his curd a second time. Shond he agam be suc cessful, hue can poruti for quinze ef le ve, for trente et te
ra, athd finally for smixante et le ro, whicli io the highest clunce in thas giole. $F$. was formerly much in vogre in France, England, and Europe generally, and still retrins its popmarity in various parts of the world. - A variety of thas gatne is also minch played by gamblers in the $\mathbf{U}$. States. One hundred faro banks are said to exist in New Cork alone; there are niso banks in almost ull other Ameriens cities. The methot of play in the U States is ne filluws: Tho deater, with a large array of cheques nt his ripht haml, reprasenting $\$ 1, \$ 5, \$ 20$, rud oo on up-
ward, takes his seat at thu contre of a table with 13 Ward, tak"s his beat at thu contre of a table with 13
caraln, represcuting a complete pack, affixed to it at concaraln, representiug a complete park, affixed to it at con-
veniont diatance to mark distiuctly the bet placed on wach. Perisns who wish to play, exclange at phasure menny for such amount of cheigueg as they desire to riak nud phaco the amomit they intiod to stakio on any partirular caril upon the talite. Tha dealer then prodares a pack of carsh und shufflen then (the option of shaflimg resting nhes with any of the players who call for it), hum thement, und then phaces them in a box, from which, one hy one, he ateliberately slider thrm. The manker
lowes when the card equal in pointe the that on which thi

## FAT

of them: as when Daniel tells us that he monrned for foll three weekx, and "ate oo pleasant bread, neither canse thesh nor wine in my month, neither dad anoint myself at all till three whole weeks were folfolled.
( $D$ un, x. 3.) Thongh fasting is not positively enjoined L, Christ or bis apostles, we have evidence in the New Testament that it was practised by the latter; and St. Panl, io eongerath the canse of thirst, io fastings often." (2 Cor. xi. 2f.) Io the earlicst times we do not hiod mention of any pnblic and of Christ's cracilixion. But in process of time fasts were gradaally introduced, first by custom, and afterwards by pusitive appointment. Tuwards the close of the sd century fastiug came to beried in a secarity againot the machioations of evil - pirits, who were believed to direct their efforts principally against the inxurions. Fastiog cane also to he regarded is the most effectual means of nppeating the anger of as ofradedispenisble luty, and expruss laws wers enacted regarding it by the rolers of the Charch. As it became more genural, the severity of it was relaxed, and a mere abotineoce from flesh and wine was judged sufficient. (Sce Lest) The strict canonical fast allows only one meal in 21 honrs. The distiuction between the Protestant and the Romnn Catholic view of fasting is, that the Catholic regarda fustiug ns a mrans of grace, the Protestant only as a uselal preparation for the means of grace. keneral sulyect of hating, all innocent appetites of the body, is entinently beocficial in assisting the operations of the mind. It brings the animal part of our aature prevent that lieavines and indolence of the factulties as well is that pertarbation of the passione, which often proened from iodnlecnce and repletion of the body. It in thise hiphly psefnl in prombting that calmuess of mind and clearnesa of thonght which are so very favorable to meditation and devotion. In the practice of fasting, then, the intelligeot Christian will out rest in the outward act, but regard it unly as a means to gove 4nd.

If both will he considered under one head. Together, they form a well-defined natural kroup of organic componnds, ovcurring abondantly in buth the anional and vegetable kingdoms. They vary ia consistence froms thin are aen-olive-onl, to hard fat, as saet. When pare, disappear when tuoderately heated. Although, is common lenguage, we sjeak of conl oils aod essential oils, ueither of these must be confonnded, chemically, with the trne fixed oils. The vegetable fits and oils are fonnd in various parts of the plsak, but most abocdant ly in the seeda. The seeds of the Crucifera especially yicld a large quantity of oil; rape-seed. for instance contasining from suls, fist is fonstributed through most parts of animals, fat is fonndy, while is fish and cold-blooded animals generally, its place is taken by ofls. Fats and oils are extracted from axinal aod vegetable matter by simple pressure or by boiling. They are all lighter than water, their specific gravity saryigeg from 0yl to 094 . They are all soluble in ether, benzole, and torpeatine, and may be mixed with each otber in any proportion. They are inbolable in water, and only to a certain extent in alcohol. They may be heated to 00 withont under going any change : bot on distilling them, they evolv acrill products, and are resers of high illuminatiog power flammable gases and yapors of the term fixed oits. Thensist of a mixture of at lenst three proximate principles in different propurtions, two of which, steario and palmutin, are solid at ordinary temperstores, and the third, olein, which i liquid. The propentions is which olein is present constitnte the real differeace between a fat and an on sume of these oils are little affected by exposare to th air, but gencrally become rancid; others ausorb oxygen, and form a resinons varnish, and are known as dryong oils. When their surface is mbch extended, as in greaey ragg and catton waste, this cbagge is sometimes at tended by spontaneons combed to fats or oils, a process hydraterl ailkties aro amification, or the formation of takes phee, The priocipal oils used in daily life are soaps. ( $\%$ c. from the kernel of the common silmond; colza oil, used for illnomioating parposes, obtainet from the Brasrica oleifera; linseut oil, sperme, whale, and cod-liver oil. The solid fats are cocoa-nut oil, which is nearly Eolid at ordi nary temperaturef, jolm-al, butter, lard, tatcow, and sueh ( $P^{\text {M }}$ ysiol.) This formation, no necessary to the healchy organism of the hody, is generated in the gystem tissne conversion of fibrin and albamen ioto adipose thesse Thongh flud in the living, it becomes solid in the de the beally, The use of fat is of the utnast one of the chicf agents in the generafor of heat. It is on account of this inge theirscason of activity, autl so emaciated when rousing from their pe fiod of reprose, or bibrernation; the adipose tissue havin becone absorbed duriag their sleep to keep up the confustion ly which animal heat is generatel. Beside supplying fuel to this vital clemistry of the blood, fit performs many other services in the animnl ectaomy: it is deposited betwren the crevices of the nuscles, ani is equally diffuscd over the surface of the body, hetween the flesh and the coticle, giviog thit expuis, round hess to the frame which mparts shch symo to the als leanty to the looks of all yonn persons, those lous erption of which in advancedtrigonistic to beanty. The eviris, altion of fit in certain parts of the boily in concencmble quantities is mother provision of nature to form resistant cushions to such parts, which, if uoprotaxted tiy this contrixance, would be exposed to jujury, or great faconvenience. Without the depth of adipose tissie deporited over the posterior moscles of the thighe and hips, nud over the soles of the feet, we Ahonld neither be able to sit for more than a few ninntes withom pain, if not danger. nor could we watk for uny distance without suffrring, - these fatty pads actiog ns shied to the mascles nom network of nerves Fiat also lubricntes plying them with life enit gensation. Fist an the same the juints and tonlons of the the axkes of locomotives ond velsicles, allows the bones to play in their sockets, and the muscles to glide over each other without wast dhagor, or triction. And, Inatly, fit audda to the specific lightoces of the body, pives on elasticity to the frame and uskists in keepiag the body from sinking when im mernell in the whater. Thum it becooses evident that certain rmonnt of fint is netually necesarry to the well belng of the hendy, and where nuele articles of diet as io tho laburatory of the eyatem are couverted fito fat, a etureh, nupur. or gum, "re not taken in smencint qua. titien, the want whonfil be componsutcl for by tre per with his ming ford. In some constitutions, the powe of eliminating fitt from any kind of aliment aomounta to what may be callest a dizerised action. for the ndipuse tif mue is guneratell in such abundatice, that the body ofter
 toaly aluggial and unwieldy, and maturially interferfing with the thoulthy function of the oppremaed organs Sometiosen this deposithon of fatty mather is fatcram only, and gom of without difphatiog any ontward nigh

 rimuly ondangermi. Tha amount of fat necessury twotlit varten with the climate, the lewer the temper
eture in which a masa liven, the larger the anomat of
oleaginons food required, from the simple fact that the colder the air the nore fuel will be required for the combuation in the langs; thos, at the N. Pole, the quantity of anctuons matter consnmed caa hardly be too great, while at the trupics it 8 nks to a mimmam proportion. It is apon the principle that oleaginous snlstances insore a fall and perfect uxidation of the blood, and a feo respiration, that mik, and sued, io consomption and effections of the air-passoge For the diseases genersted by excess of fist, see Osesitr.
Fai, v. $\alpha$. To make plump or fleshy with abondant food. We fat all creatores also to fat us," - Shake.
Tin. To become fleshy or plomp; to grow fat. Fa'tal, a. [Ek., from Lat. futalis, from fari, to sperk, destiny. mortal; destrnctire: calamitons; said of a - Deadly; mortal ; destrnctive: calan

Fa'talism. $n$. The belief in an overruling fate or des. tiny which anmihilates free-will and controls all humats actious. For the philobophical doctrine of $F$, see Necessirt ; for those religious opinions which have assaned a similar character, bee Predestination.

compressiag filires of wool, for, sad other substancea fit fur the purpuse, into a compsct body, hy what ie teruned the fefting process. This consiste in mixing the filurus of the materials employed until they hecorue interlaced or mitted tugether in the form of a soft. hoose cloth or sheet, which is done by the instronentality of carding-and dofting-machines. The cloth is then wonnd on a roller, and carricel to the feltivg-utachine, iu wluch the fibres are combined and interlaced still moreclosely by the action of heat and pressire. Dntil the loose anbof grest streogth snd durability. F. of a fine kind is used for making lati (see $\mathrm{H}+\mathrm{r}$ ) ; and a coarser description is used for table-cluthe and carpets. A stiff rongh $F$. is also manufactured for duaking roofing for slueds, and coveriags tur hay-ricks and cornstacks. as well as supplying a lining to the copper sleathing of vessels; and another sort for cosering steam-boilers, for which it is well adapted on account of its properties as a dud-conunctor of heat. The last-liamed material is dade of the waste woullen cloths used in paper-mills, reduced to n pulp, and beaten together nfter being put on the hoiler in a wet solid, and ptterly impervious to lient. All the other different kinds of $F$, are made by amalganating the materiale by the agency of heat, moisture, and pressure Table-cloths of this material are either embossed, baving a raised pattern in one color on $n$ gronnd of auother bue, or printed in a variety of tints and debigns. Carpets of $F$, are also printed in colors. In addition to being inexpeneive, they are warm und conifortable, the closeness of their texture presenting draughto of wir from entering an apastment through crevices in the flooring; they are also tolerably durable, lut, on account of the pattern being printed on the surface of the faliric, the colors are alyt to fade and encome watcoprouf ty constant wear, Roonge-F. is rendered watc-proof iy clemip sud much used for roofs, being impervions to rain. To preserve it from danger by fire and from the effects of the weather it is corered with coal-tar mal a layer of sind or fize, clean gravel. Felt is nlvo uscd for lining wooden buildings snd the walls of roons that arc aflected by danp. It is further used for water-l|ght compartments in ships, for sume kinds of heavy clothing, for lif ing conts and dresses, and a great varicty of ather purpoess. Some ascribe the invodion of $F$. to St. Clement, Who found the carded waol, placed in his shoes to protect his fect while on a pilgrimage, worked into a folt ly the preveure atu moisture: by ofthers it is enid fo have far their tents, and intruduced into Europent the time Pelf, a To -Tu eurround with felt: as, to felt the drising axle of a mill. liwal Syinstem, $n$. (Hist.) That constitutional sys. tem whech was mtrodaced into Europe by the northern nations after the fall of the Romall puwer, Rud which pean conntries. The constitution of feuds had its origin in the military policy of the Goths, Ifuns, Vandals, und ther norther nutions, who overtion Enrope at the delenofon of the Roman Empire. The term fend ie of very doubtful derivation, but most probably it is formed from the Tentonic fee or frh, waged or paty for service, and odh, or od, property or poosestion ; a find, then. being the property or possebsion given as wages for service. In order to secure their newly acquired pos scosions, and at the same time to reward their degerviag followers, the conquering generals were wont to atiot large districts, or parcels of lian, to the superior ofice smatler tulutuncnts or parcely, to the inferior oflicers hand suldiers. Tho condition annexed to these holdings wis that the possessor should bo survice fauthrully, buth at hone and in the wars, to him by whon they were given; for which purpose he twok the oath of fealty Jurctuentum fuchetatis), and in caso of the lireach of this condition and oath, hy not performing the stipulated service, or liy deserting the lord in battle, the inds woro again to revert to him who granted them. The ow therehapy of the lanel, theretore, properly remaned in the hands of the supurior, abd prohably at first nats remimable by him at phemsure, or at leart on the acath to asamue an herulitary cherseler, the rights of a wape rior, on the deuth of a vassal, being confined to the exwetion of ewrtain daes from his son mat naccesenor, os connjerntion for contiruing to him the feud which his father law hefle. Where the lathd dencended to at fenale, the wiprios was entitied to control her marriake, fors the purjuse of procerimg a trustworthy vasmal, a privilege. Which, like the ather, was afterward converted hito "pamaiary payment. Accomding to this syatem, every
recoiver of land, or fendatory, was bonad, when cathed upun, tomerve his immediate lord or superior, and to do "th ith has powar to defroth him. Such lord or superiur was higher anperior ur lorl; and so on apwards to the prince or cocally tomad is their reasicrive growations to protect the possomsions they hasd kiven. Thus the comenection pearaate of is matual watorchange of lathefita - of lomaty and protectinat on the obe humd, nod ot gratitide abil mervice on the othor. In this wigy the frodal con
neetion whe estatilinherl, und an arniy wus always is conmatul, rembly to tight in defelte of the whole or of
 of tharape, und many of them what were Jategnoment
adopted this fystem as a means of strengthening their power, parcelling out their royal territories, of persuadlanded proverty under the like fendal oblizations of military fealty. Thus the feadal constimation, or dectrine of tonare, extended itoelf over all the Western world; and the fendallaws drove out the konam, which had hit herto universally prevaled. This system was nduptel in most conatries of Earope from the 9th to the end of the 13th cent. : but it differed in various particulars in the different conntries. Theugh there can be no donbt that feudal printhe Saxuna io England, yet it was unly when that country waty eomplucred by the Normans that it was regularly estabished. It some respects, however, the syetem of feadalism estahlikhed in Elughand ditfered frum that of Frace, from which it was taken. One of these war that the king was the unitersal lorit and original proprietor of all the lunds in his kingdom, und that no man could possesn, or hold, any part or it, but whas was nedistely or mamediately derived from lim, to he held mediately or inmediately of him upon fendal service. Hence the Conqueror introdnced the practice of contpelling those holding mediately ws well as imnediately of himsenf to swear featy to bim; and thas the inforior king, the other of fealty to their immelliate superior It has been remarked however, that wheu the two in terests came into collision, the waseal rarely failed to obey his lord rather than his king. $A$ conntry, onder the fendal law, wato divided into knights' fees, the ternant of each of which appeatrs to have heen whbred to keep the field at his uwn expense for forty dias, whenevet his lord chose to call upon hins. For smaller purtions of land, smaller periods of servicus were duc. Every great tenant exercised a jurisdiction, civil and criminal, over his immealiate tenants. and beld courts, aud md minastered the laws within his loruship, hinea bovernigll jurialictions within the kinglom is one of the fintures of the $P$. $S$. The land meliented to the lomi when the of the $P$. S. The land melseated to the loril when the temat loft no hejr. sDis it was forfer ed to gath of fealty or of felony. There were also fines payable to the loril on certuin occasions, as well as sills, reliefs, \&c. The vassal had also to atteod the lord's cunrts, sumetimes to witness, and sonnetimes to tiske jart in, the udministrafinn of justice; in lattle, be was buond to lind his horse to his lord it dismonnted, to keep to his side while fight ing, and go into cartivity as a hustane for him when then. It was a breach of fath to divnige his (the Lord s) cotasel. thers, to injore his 1 'endary, $a_{\text {. }} 110$

(Law.) A $P$ of law [lint. fictio juris] is a supporition of liw that a thing is trne, wimhut ingmrimg
whether ic be so or not, that it nayy hivo the cffect of truth so fur as is consistent with equity. The utility of snull fietions is unerely, by substituting the imaginary fur the true state of the case, to pass more rapidly over those parts of the sabject which were not disputed, and arrive at the points really at issue. The fictions of th Homan lnw apparently had their origin in the cdictal power, and they were devised for the purpose of provit ing for cases uhere there were no legal provisions. Fic tions mnst be framed according to the rul of law, and there ought to be eqnity and pansibility in every legal athough at first they may startle the student, bo will finl, upu forther culsiduration, to be highly hencficial fimp, uncful: olservel, that no fiction shall extend to work an injury its proper opration lieing to prevent a mischief, or rem edy an inconvenieuce that might resalt from the general

han Philadelphia. The fig is a low, decidnons tree or shrob, witb large, deeply-lobed leaves, whech are rough with short bairs and the bark is greenish. The frnit. termed Sgcomas, is protuced singly is the axils of the leaves, is pear-shaped, and has u very sbort stalk; the colur in some varietics is bloish-black: in othens rel, purple, yellow, green, or white. The varieties in cultibation are aumervos. In warm climates, the fig gields two crops in the year - one from the older wood (nidsumiter slrouts of the precediay year), and a secoad from the young woot (spring shoots of rue eame year) bin Fis-lrues are prowitated by sech, by suckers, \&c: rery frequontiy liy layers of by cattingo. Dried figs form an important article of food in the lecant; in more northern regionas they are used for dessert, or for medicinal purposes, bsing applied to gum-buils and other anr"s, and utso administered in pulmonary and nephritic affections, and to relieve hubitnal ennetipation. The pimije contains abont 62 per cent. of a kind of sugar callequigur of Figs. Figs are eithor dricd in the 8 om or in orens built for the parpose. The bust are numbly brught frumsayrnit, ath are know a as ThFley figt, of which thone called Eind portumb a suirit is distilled fram fermented figs. Thongle sulfected to a very hieb duty ad ralorem, figs are an isuportant item of importation in this comntry. The total value of importation for the $y$ var $1 \times 68$ was $\$ 242.455$, for which the Custonis received the large sum of $\mathrm{s}=005,705$. - The milky juice of some species is bland and almalant, ns of $F^{\prime}$. Suastereond. In ohbers it is acris. That of the Common Fig jradicen a burning sensation on the tongue. That of froficario, a nutive of tho Malayan lalands, is used for puikoning arrows, Lac is gathered from nome eperies. The leaver of $F$; phe litoria are so rungh that they ure used for polishing wood and ivory in Indin.
'idi, $n$. [From Lat. funderre, fitfi, to divitle.] (Noul.) A or liganm vita. nsell in separnting and interlacing tho strawis of which the splicims-rupe is compusel, - A mast-fid is a lomlt inserted thruach the lutton of a ship, topmast or tup-mblant-mast, with cuds restith on the trestle-trees sustained by the head of the fower mant in topmast. Unless the mast-fid be withdrawn, the nupported mast cannot be lowered.

fluide transparent, or for the purpose of separating and washiog precipitates. They are usually made of una funnel (Fig. 1012). When the ingnid to be bitered is corrosive, saod, powdered glass, or wisps of asbestoe, are generally used. When a liquid contains mucilaginons or other matter having viscous properties, there is consiterable difficnity in filtering it, as the poree of the redium becone filled up and made water-tight. Special filters are therefore required for syrups, oils, dc. Such liguids as ale, beer, \&c, would be exceedingly difficult to filter, aud therefore they are clarified by the process iescrilied made of twilled cotton cloth (Canton flannel). These are commonly 4 to 8 feet long and 12 to 15 inches in diameter, and are enclosed in coarse canves bass, 8 or 10 inches in diameter; and thme the inner filtoring-bag is corrugated or creased, and a large surface in prophrtion to its s'se is thns presented. Syrups are filtered on a small scale by confectioners, \&c., by passing them through conical flannel bags, and on a large 8 ale in the creased bag-filter just described. Thick syrups bave the be dimited or claritied with white of egg, to ollect the sediment into masses, and then they may be filtered ally require to be treated iner. Vegetable juices generfiltres for purifying water, either for drintingor culinary purposes, nre male in virious forms. in paris a large quantity of the river-wetor is purified ly paving it through boxes, at the luttom of which is a layer of charcoal between two layers of saod. But the cintrivance which we especially with to recommend to the notice of our readers, and particularly of hunters and travellers, is an apparatus that in the bush or slirub, where water is often 80 loaded with sand, and no 1 ad as ecarcely to be fitted for uae, is no invaluable companion.

Fig. 1013. - 8UCKtNG-PILTER.
The instrmment as shown in nue io Fig. 1013 fully speake fo. itself as to its utility. A small sphere of carton, to which a guttu-p.relin tuhe and mouth-piece is attuched, comprises the whole invention, with the exception of a fin box io which to carry this unique drinking-filter. The merits of this little filter, however, do not end here, for it cad be made to unswer the purpose of a famity fiter by merely sinking the cirrbon toto a pail of water placed on a tillite, exlumsting the air from the tube mouth-piece into a it ovtr the xide, and inserting the stream of filtered water will continne to flow as long as any remains in the pail

Fin'ing, $n$. The act of imposing a fine (Duzuf.) The process of retining, purifying, or clarifying thrraid liquord. The simplest mode of ing the passing the liynor thrungh a poreuk oubstance that
tans the solids and siluws the clear liquid for pass through (sce FLITER); but this nethod is only applinable to particles osechanically suspended io a limpid linuid. Whed the liquid contains mucilabivous or other matter, that readily clogs the hiter, some other means of $P$, must be used. Such is the case with sll malt liquors and oost wines when turbid. When in good conditioth these do not usually require $F$, as the suspended matter
 place sume mes ef promuling such action are usually place, some means of pronotiog stach action are ustaky stach is white of ege, to a portion of the lignid, and after heating it well in this, to add the mixture, and stir it into the whole of the liquid. Upon the application of heat, the allommen congulates and contracto fromits diffusion into a scum, euveloping and drawing together
the suspended natter. The scum is then ensily re the suspended natter. The scuns is then ensily re moved. This methed is adopted for syrups and other
liqnids that may he heated withoyth mischief. In making clear soups, the albnmen of the meat perfornis this function. As alcohol coayulates albumen, it may hee nsed for P. wines nod cordials withont the applicaliquors are usnally fined by means of gelatine, either fisinglass or cheaper substitutes being nsed. One ponand of isingliss is suaked io three or four pints of water or zour beer, then more sour lignor added as the isinglass swells, until it aunonnes to about a gallon. The jelly thus formed is next dissolved iu seven or eight galloos of the liquor to be fined. Thas solution, baving the consisteace of a syrup, is called brewers' finings, and abont a pist to a pint and a half is added to a barrel of ale or porter, or to a hogstend of cider or wine. The artoon of this depends apon the combination of the gelaliumor, forming thereby an insoluble sulid, which sink to the bottom and curres with it, like the collrulateng albmen, the suspended matter; tut as the flavor of madt liqnors partly depends upun the astriagents they mantain, the $F$. affects the favor: the astringants also help to preserve tho liquor, and hunce their removal is in this respect disadvantageons., Malt liquora thns fined do not "stand well un draught." the use of gelatine for $P$. red wines is oljectionalile as in most of these the astriogent flavor is an esteenced quality, and therefor albumen is preferred. - There are other methods of $F$, bnt all of thenare moreor less oijectionabie. Liqnors coopera and cellarmen.

## F'ire'-dises

whith eoathes n. A kind of drces or mody-covering and even to pass througb, a fierce flame, to rescue lives or property, or to extingaish fire.
Fire'eater, $n$. One who preteads te eat fire ; - hence, $n$ ciant term for a fightiag character, duellist, or dedperado Fire -encrise, $h$. A machise contrived for the purpose a jet. Previons to the invention of the modern fire engine, there were varions modes of extinguishing fires Juvenal and Pliuy both mention methode, and Pliny the younger speaks of pines (siphoaes) being used to put out fires. Augustus appointed seven bands of firemen at Itome, each of which lad the care of two divisions of the city; each brod had a captain, and at the head of the whole body was the prefect of the wateh. The earliest account. however, of any machine resembling the mudera firveogine is given by a Jesuit numed Caspar Schott, in 1657 . It wis a sort of force-pump, aed was in diameter, to the height of so feet. After that time the use of fireeogines leeame more general; but two impurtant parts of the machine wore nut intrudnced till a later perind; riz., the flexible hose and the air-chamber. The rise of flexible tubes is obviens, and the airchamber, which depeods for its value on the increased elasticity of the air wben compressed into less than it usual lulk, gives a steudy and uninterrnpted stream of water. The use of leathern pipes was first devised by
two natives of Ilelland, named Vanderheide, in 1672 . two astives of IIelland, named Vanderheide, in 1672.
After the iovention of the air-chamber, all new improveAfter the iovention of the air-chamber, all new improve neata were merdy in details. The modern eagine con-
sists gencrally of two vertical double-actiog (or sometimes 4 single-acting) force-pumps, worked by meins of long brikes, that eqable nuany men to assist in usios them. The pumps discharge inte one common reservoir the upper part of which contains air thant by its elasticity caases the water to fiow in a nniform stream through the discharge-pipe. From this pipe the water is conducted any desired distance throngh the leathern hose, and discharged through astrong tapering tmetallic Pipe, that is leeld in
the hand to direct the
stream upon the fire. A euction-pipe is at-
tached to the lower ached to the lower
end of the pump when required when the required when the duced to supply the pumps has हufficient head. The whole machine is placed upen

constructed firit, and Fig. 1019. - bTEAM FIRE-ENGINE. furniched with such implements as are likely to be wanted at a fire. In Wurking the F. E, rupes are semetimes made fast to the brakes, nad passing through blocke at the bottom of the carriage, wre hated upon by a number of men with each down-stroke. Sume engines have the pmops arrangel hurizuntally, and mea sit on the top and work
as in rowing is loat. In most of the cities of the United States, the engines are nunaged liy volunteer companies of firethen, who serye without pay, but are expmpted from military duty. Separate companies, called thase compraies, and Iluok nad Labder companies, have charge of prent euppice of hose, and of the long laddere, the ron hookd and ropers used in pulling down walls, \&c. whict are carried upon ecparate carriages. It is con sideren a gerd performance for a first-class hud-emginc of throw a stream throngh 100 feet of hose to the hejght intronfuced into most of the large cities, and nust cwent nally sopersedle all others. The first atteapt to apply ktemin to the working of fircengines was made by Mr Braithwaite, is Loodon, in 1830. After the great fire in New York, in $1 \$ 35$, premiunas wero offered tor phans of stemm firm-bgines, and in 141 one wat built from plams
of Mr. In ginal effect. The ereat ditticultics in the why of the successful use of these first engines was their sremt Weight, nud the leagth of time reynirel for risising steam. The city of ('incianati firnt demonstrated the practacnbility of this applicatison of steam, so as to completely firat of these engiues wish luilt ly Mr. A. B. I hith, in 1s:3. This machine was very large and powerfal - lut very heavy - weighing upwards of 12 tons, and requir jug 4 hirsen to hanl It. This marhioe, with some few athers, wis constracterl na ne to upjly the stean to the

 firc-lux upuen ut the top, whe the upper juirtion of the

(pl. Fisues. The singular, however, is oftee need for (pl. Fisues. The siugular, howeve?
fishus in general, or the whole race.)
-The flesh of fish, used as food; - in contradistinction to that of torreatrial atrimule, which is distiuctively denum nuted flesh; as, in dinner of fisth.
A conster, used for marking the acore of variona games,
(Zoül.) The name applied fo a class of animals excluaively aquatie, and ocenpyigg the fourth ant lowe station of thesection vertebrata. The beat is large, and set upon the neck without the mervention of nuy dis tioct neck ; the body is usbully of a spindle-whape, taper ag gradnally towards the extremity ; and the aurface i mpede the In ite general form, the body la usully roupled dijhtly compresacl it the sides; sometimes this fit teniag proceuds to a much erator extunt so that the animal presente the appearatace of a broad hand, or oval disc, of which the edges correspond with the doran and rentral surfacuas: in other cases, the finttening take place fromabove down wards, proclucing a dinc-like bedy, of which the upper nind lower enrfincis are dorsal and ventral. A fish may be shortly lefined as sul unimal breathing through the medimm of Water by means of cillm; and in giving it our considoration, this latter nyparatun in the most unportant feature presented. It is ons lamine fixcd on arches, Thene lamins aru coverel ond mmine fixed on arches. Theno laminararecumerod as to present a considerablesenfive to the water, so that hw blood may receive a sufficiont portion of the oxyren contained in that elemmet. An the water in contact with the gills becumes deteriurnted, it in necensary that constant curront lie cansed to tow over them. In most fishes this is effected by their taking water In at the month and expelling it at the kill-rovers. The hlook,
which in constantly ment from the gilla to the heurt, is diatribnted by meman of the urterion to every part of the bualy, whence it retnrna to the heart by muanan of the bina. Allmaln of thin urdur are fir the mont purt fur which, with it in uir-blaulder in the inturior of the hooly a tobu, muat be regaridel to a cortain extent analoguun to the longa of the air-breathing vertelirata. This eac

 enir-hlahliker, luwnvor, lun nothing to do with reapira
 of mac, tho apecitlo By the dilintation or cumpreanion
and, neted on by a chrions muscalar apparatus, render pussessor llegiter or heavier than the surfondin emebt. Tue limus of the fish are formed ioto fins fues, und the poaterior extreanities, the reptral. Besides hue, und urlipury fialues are furuialed with one or lursal fins, an apul fin, and a candal fit, or tall 1 n dursal fins, an anal fin, end a candal fin, or hall. In round the whole posterior purtion of the body; and this is the condition in which these organe first make their appearance during the development of the emuryo in all fishes, the subsequent changes which tak place in the arraogement of the parts heing due $t$ he unequal descropment of the boay rays, which apport and stretch the Esemtrane of wich the tma are composed. The pectral in in all hishes connis fhe same parts as the intcrior hmbs of any ormer diately behind the branchial openings, is fonnd a bony dircle, composed of several pieces, representiag thi houlder-blade, with the coracoid bone and clavicle This supports the bones of the arm, which are usually ery short, and bear a series of carpal bones at their extremity; the latter supporting a number of shor cyliodrical jointa, whence the rays of the fin take their rise. The interual smports of the ventral fins aever present such a cluse resemblance to the pelvis of the higher vertebrata as do those of the pectorula to the scaputar arch. When aituated in their nornal position hony pieces lyine freely in the muaclee and quite an
 re adraned frum this pusition to the neighturbwed ur the pectorals, their internal supports are uttached to the scapular arch of the latter members. The principa organ of motion is the caudal fin, or tail; by this it $i$ propelled. The dorsal and ventral fins serve to balanc it. and the pectorals to arrest its progress when required. The bones of tislate are of a lens dense and compsut an ture than in the higher order of animals, and ulway rebain in an isclated state, similar to that of the embiry of the mammalia. The skeleton mity be divided int cespiracy espiratory nypary of rest end and pierced in the middle; and when joined to gether, the hollow space between each two is occupied y u gelatiouns substance, which parses from onc suace to tho next, throngh the hole in each bone. This hol is usmally very gmall, but in some of the chondropters giane it is so large that the bodies of the vertebree ar mete rings. To the vartebre are attached the ribs; fact, the ribs are the main enpport of ill the other bones The head varice more in form than in any other clas of vertebrate animals. The same bones as thrise foum in other ovparone animads are nlmost inwaye traceabl The upper juv coneisto of inaxim lary homes cuastitute the chief portion of the uppe juw, the nasillary bones being placed behind and pai Bllel to them. The lower jaw is composed, generally of $t$ wis bouns on each sille, the dental portion in front and the articular portion behind. The form of the lood is for the must part suchas mechanical principles tenct to be best sudapted for moving with least resistance through a liquid medimm. The surface of the body is cither bmooth and lubricons, or is covered by closely imbricated scales, rarely defended by bony plates or roughened by hard tuborclea, still more rarely armed preante hut one partial enlargement and that of com paratively small size, nt its interior extremity formit the brain, which consints of a succeasion of citughoui masses, ment of them exclasively upproprinted to the functhun if arrve of epertial seuse. The puwer of touch can bo but ferbly doveloped in fishes. The orem of tinte is a very inconnpicuons one, - the chief function of the franuework muphorting it, or the hyoidan apparatue relating to the nuechanism of swallowing and breathing Or the organ of hearing there is no ontwardsign: bnt the essentisi part, thencoostic labyrinth, if present, and the memicircular canal, Iargely developed within the labyrinth, is without cochles, and is rarely provided tho
 of a lashrymul organ. Thealimentury caul is comumbly of aurhrymulorgan. Thenlimentary cabal is commont markel, the nlatert und wide gnllet heing lamily diatio cuinhalite from the ntomach. The panerens, for the inoet part, retain its primitive condition of separat creal approulugen to the dodedum, Tho heurt consist usentinly uf one uricle unt one ventrieles receiving the vousum thoon anil propelling it to the gills ; whence

The Argand barner (q.v.) sad chimaey, us applied to gias and cabuphene, are exutaple's of this. Flase has 3 distinct parts: the ceatral or son-lumidous part. where there is no combantion, but where the carbon begias to separate from nous part, where the carbon is for a moment free and licated tus white heat ;and the exterior part which in the hottest, and where the combustion is cemplete. It is easy mow to understand of what impurtance is the form of the buruer, aad huw it muy be modifieel accordiaglyaswe desire light or heat. If we wish hight, the come secouds from protected fur thes air: but tut long enuwh to hllow it tu pass fing eong to If, on the contrary best is de sired, the carbon must lee burned as quickly ss pussible. The Gorman cheamist Bunsen constructed a gas buruer utter this theory (Kig. 1026), which is perfectly adapted to the prodaction of
care makt he taken
By paying proper hest. In this lumer the ordinary
 illnminating gis is conyeyed into a wide tube, at the base of which is a great number of small holes for the udmiswionof air. The air is thas intimately
mixed with the gas. mixed with the gas; and it is this mix-
ture, of which the preportions are reg. ulated by the dimensions of the openings, that is ignited at the ton of the tube. The flame obtainel is sery prele, lut inshust the small holes that allow the adaiskion of air, the flame becomes hrilliant, Every mixtare of gakers requires a corinflame it: ant if the temperature be nut reached, the mixtmre does not thke fire; we may thins cool

Fex, v, a. Lat. Hexus, from flectere, to tura. To bead. 'lexam'imous. a. (Lat. flectere, to turn, and amimus lexibility, $n$. [Fr, fromlat fer
lexibility, n. [Fr., from lat. flexibititus; from flec tore, to turn.] Pliancy; pliability; readivess to bend
(Phys.) The property which all bodies possess to
greater or less degree, which is evinced in their dispogreater or less degree, which is evinced in their dispo-
sition to yield or change their forn in right angles to their length, throngh their own weight or by means of any pressure or strain applied to them. Pieces of the sume onterial differ from each other in the degree of flexibility they exhibit, in proportion to their length and thickness. Thus it is evident that a cylin drical har of iron an inch in diameter and twenty feet in length wil exhimit a far greater degree of flexilrility than another which is only half the length, and has a the exinet of two inches. This may be seed by resting the extremities of each on supports of equal height, its own weight its centre being considerable through chord drawn trom one end of it to the other. while the thicker bar would be scarcely bent out of the straight line. Haterials also extribit a greater degree of flexstaty in one condition than in another; metals, for instance, yielding fir more readily to pressure when wonld sustatinen cold. A wronght-iron becm which tion when cold great weight withont perceptre der same weight when red-hot. The grent tlexibility of rupes of hemp and metal renders it quite impossible to seen in the case of a rope stretched for the performance of a tirht-rope dincer whethed for the performance not exbilit dexibility in some degree beran that will no substance in nature that is perfectly rigid mal in Ilexible; bat the degree of flexilility possosed by fuy material is denoted by the extent to which it will hend or by the wejeht which it will support withont breaking This property must nut be confounded with that of clasticity: clastic bollies will return to their former slape when they have been bent or altered by pressure many way; but hodins which possess fiexibility without elasticity do not return to their original form in all cases. A stratght bur of iron, toongl bent by its uwo Wrifht only, will mat exactly resnme its origimel shape, deflection flexilibtity of berns of wond ration of the and girders, has well as of ropes of wood and iron bars materials, is an impurtant point in the construction of hinibliara, brideses, and enginecrine warks of sarion kimes. - Sce MAtERLALA, sthenotio op

variety of quartz, altieal to Chutedony, variety of quartz, altiol to Chuterdony, 4. v., but more and brownish-tiatk. It breaks with sharp cottin edges and in conctobibal surfice. $P$. is nowarly pure sulica times in flat tabnlar bamds. These oodules comesist largely of the rem tins of infusoria, mpanges, and other narime productions. Tho coloring-matter of the common $P \cdot$ is mostly carlionaceous matter. and it a+ually eontainalso afont one par cent. of alamina and p-roxidenf iron, with one or two of witur. After being calcinel unt
ground, $F$ : is often used in the manufacture of glass, earthenware, and parcelaia.

Flimi-heart. Flint'-lsearted, a. Having a havt Flini Insiplemesisu. (Genf.) The name given to
 have lecen hiveoserel from time to time, by bejng wecidentally torned upi whilst phoughing in fivlds, or by the zealouvscarch of some indefatigathleantinu urian. Those slightest reapect from the rinle wrapons constructel if flint which are urel even in the presont day by tho sategges ithabiting purtions of A ih.s, Anerica, Africs, and the islatuds io the Indian Archipelagonnl the Sumth peats, Arrow-hesuls nuil hitchets are the forms in whicht timited variety in the shape unll constrnction of even thase. The precise nature of these implementa, the fact that they mast bive been of hum in na innficture, anit the clear proof of their position in aitu with lonessand other reasains of animals contemporanemz with the savaros who ma le the implemputs, are the points of chief interest. Thiy are primeipully compenst of flint, but incinde granite, juie, surpentine, jisper, hasiat. And nthir stones. Mang of them are an slightly ntul roughly manntacturid that they might of themselves escape mo tice: lust some, and of these some in ewh important Wality, are distinctly cut into definite shapes, alw.ys
 heads, axe-he dd, lance-heads, unl rough knives. S, mo few are even mure carefully fini-hed and winothod. The most numerons are flakes of flint apparently int bild
for knives. The noost perfect are oval or almond stones. So large a number of them have been found in certain spots as to leal to the supposition that they hav been intentionally hurierl, or that a manufactory of
them exinted there. Tue chinf localitios for thesp obthem existed there. The charf localitibs for these of-
jects, at first, were two or three gravel-beds on the hankof the som ne, near Amiens und Alsbeville, in France, Mony caverus and some gravel-beds in tho southeru am Western parta of Englan have since volare them. Italy, at ways with the sume astornationant frugn-ntary, but on the whole catisfactory. In the first plave, the gnowel is wnllisturbed, and it is clear that all pirts of the deposit mutht hive been placed whero
we find them at sime one tine, and have since hem covered up by a natural accumalation of subsoil and soil. The flints are fonnt not at the top, nor nlways near the top, but occhpying a definite plare in the mas enther with or bulow the lnmes of extinct quabrupeds snch as eleplants and rhinocerown. The matunilly broken anil rolled fints are westhered שיneruly in at particular way, and thuse nenlpmed fint-are weathered in the sume way and to the sam + extrit. The grave neighborhowi, that the guncral level of the whote land must luve chawiel sigce the depent, to acrount for its aecumblation. In the sase of the cavirns, the ituple ments are found sealel ng with extinet bones, hy a natural incrustation of litasatone, and then, after hoing thus suated up, deposits of more recent date have been
lueapeal upon them. In some chases the ifuplementh have livepel upon them. In some chses that fond under the hones of animals thit have ejther
been dird on the sput or been dragitel into the cave whil, rianuceroses, eleplants, anl hipherpitamases, of ixtinct species. Hurus of reindeer, on which are etched rectus. nizable figures of the refluleer, have been founl with inpleacuta sud human bones in the sonth of France. As nt gon ral result of this carims inquiry, it would seem

 the sumke that urixem from lournhag uny kime of fasel in a

 the throut of the lather. When a untuler of ilave are
bnilt close logether in a party-wall hetween two honsew, or in the gitble-enuls of a single hunse, the wall itselt is called a sfuck, or chimney-stuck, nad that part of it whed risses atrove the roof is called the chrmney-shaft. The
walis which separate fines luilt side by side ill a stack are called withs, the walls which furm their front and back being named the broast and back respectively The horizoutal section of a flue is generally oval or circnlar in form when the wall is huitt of stone, and rectanguhar when it is of briek. When flacs nre buit side by side in the party-wall of two houser consisting of three or mure stories, that which rises from each fireplace is constructed to pass ppwurils thrimuth the wall on ons side of the flne, whicb is connected with the fireplace in the room immediately above. Coimutys in all turns in a chimuey slould lue studnally curved, care being taken to acoid anales, which aford convenient places for the accumulation of sout, and impede the free passage of the sweephing-machine through the flacs. In addition to this, ungalar tarnidgs in fines frequently lessen the free dranght of uir that is necebsary to carry off the smoke of the buruing fuel below, and thas offer an obstruction to its ascent which camnut be reachly removed. The crast of the ascent of smoke in a chiminey is simply this: the fire lurning in the grate livato the air in the flue, and canses it to become mush ligltser that the cooler air that fills the ajurtment with which
the chimaey commanicates; the cooler air lueing lewaicr then the heatednim which hais heen rurefied and expanded by the warmoth of the fire. rushes into the firepluce end by the warmoth of the fire. rushes into the firepluce and
forces it upwarls; this hecomes heated in its tarn, and is displaced ly ur rish of cooler mir: and this process lieing eontinually and rapidly repeated, an upward current of air is produced, which carries off the subke and vapor arising from the combnstion of the fuel leluw. To prevent a chinuney iront smoking. it is necessary to let the flue be as high and as straight as it pussibly can be, kince the draught will he greater in propurtion to the height of the chimney nod the alsence of ull interior obstructions in the shape of elbows or angutar turnings. In the next place, the openimg of the firc-place and the reniently cas be, that the greater part of the notey conair may pass through the fire priour to its asceut, and thir thay contraction of the chionney may cause it to rush throngh the narrow vent formed for its excape with greater force. The expeliency of reducing the upening of the fireplace as far as suitibleness will ndmit, may be shown ly holling a newspaper before the orifice abovo the cavity which contains the fire. This will cause tho fire to "draw 11 " instantaneonsly, und lireak into a blaze, - an effect which is prodnced solely by lessinimg the opening by which air is malmitted into the chinntwy nud therely cansing the air itself th puss through the Ge before it makes its way into the fins, If a chiminey it will rery rarely be found to emuke: and evern stimk chinneys may lo curad by lusing reconrse to these precautions, and by removing any olstacle thet may exist in tho interior to the free pursauce of the air and smoke. To prevent the entrance of sutklen kuats athl edilies of wind, the chimney-pots, which are almost alvitys placed on the chitumey-shafis to contract tho space thrungh which the smboke rectpes mio the open air, tro generally knrmonited with a revolvitg cap or conl made of metal, "hich is constracten in sach a manner that it is turned by the wind like a vane, and constantly presents the ornace thronglt wheli the shanke posite to the point from which the wind is blowing. A posite to the point from which the wint is bowing. A is ubtained by pacing a horizontul whed, similur to the propeller of a stemmathip, over the top of the clifeney turned ly means of the wind, thus crenting a current of uir up the flue.
(Einginerring.) A pasage surrumbledliy water, for the gascous products of combimstion in $n$ stemu-builer. - in distinction from frelies, which hold wutcr, und are une roundel by fire. Small therare called fluc-tubes. Helsiter.

（Arch．）An apright chanmel on the shaft of a celrmn， （Figally ending hemisplerically at the tup atod bottons times semicircular，ur sepmeutal or elliptical some times semicircular，or segmental，or elliptical，as in
some examples of Grectiao architerture．The Duric columo has twenty flutes round its circuraference；the Ionic，Corinthan，and Composite lave respectively twenty－four．
Flute，v．$n$ ．To play upon the flute，
v．$a$ ．To sing or play in a suft tone，similar to that of
a flute．－To form flutes or chasels，sa is a colurun， a flute，－To form flutes or chansels，as in a colnuun．－
To form or shape，as correspondiag chandels in the muslin of a lady＇s rufile．
Fint＇edi．$p, a$ ．Chaooelled；fnrrowed：as，fluted columps．
Flut＇er，$n$ ．One who plays npud the finte，One who
maker，chadoelled work on columas．
Finf＇ing，a，A chamel or furrow
the muslin of a lady＇s ruffe；finted worlums，or in
Fint＇ist，n．A perfocmer on the flute，
Fint＇ter，v，n．［A．S．Hoteran；D．flowderen，to flap，to Waver；Ger，flattern，to onove about with yuick vibra－
tions；allied to flit ］To move or flap the wings rapedly tions；allied to flit．］To move or flap the wings rapidly， without flying，or taking but short flights；to hover．
－To move abont quickly and irregularly，or with great bustle aud show，without conserpuence；；as，the fops who flutter is the ball－room．－To be io agitation；to be ia a etate of uncertainty；to waver；to fluctuate．
＂We Auttered upon the wings of doubtral success．＂－Howell．
－ $\boldsymbol{v}$ ．a．To hurry the miod of；to agitate；to disorder；to
throw into confusion．
Flat＇ter，$n$ ．Vibration；nudulation；quick and irregular motion；as，＂the flutter of a fan．＂－Addison．
－llurry；tutault；agitation of mind；confueion；dieorder；
Flutterer，position．
Klut＇terer，n．One who flutters，
Finf＇y，$a$ ．Naving the sound of a flut maner
Fiuvinu＇na，in Fete sound of a flute．
Fouvait nat．in Veto York，a post－village of Chantanqua
Flavan＇ma，in Yirginia，a Sp．
170 sq．m．Riverf．Jatnes a sud Rivanos rivers area，nbt．
170 diversified；zoit，in eome parte fertile．Min．Gold．Cop， Phalmyra
Flu＇viai，Flaviat＇ic，a．［Lat．fluvialis，fluviaticus，
from tluvius，a river，from thuere，to flow．］Felonging from fluvius，a river，from there，to flow．］Belonging
to rjvers；growing or living in streams or poods；as， to rivers；growing or living in
finuratic plants，fluvial depozits，
Fin＇vialist．$n$ ．A persoo who us Natadacea，q．$v$ ． Fin vialiof，$n$ ．A persoo who undertakes to explain
the geographical or geological phenomena of a rugion the gergraphical or geological phenomena of
or country by the action of existiog streams．
Fin＇viatile，a．［Fr．，from Lat．fluriotilis．See Fluvial．
Fin＇vo－nurine＇，a．Lat fluvins，a river，and mur nus，from mare，the sea．］（Genl．）Nutiog such formations as have been deposited，by the agency of rivers，st the bottum of the sea，at a greater or less distance from Flacir mouths．－Craig．
Flex．$n$ ．［Fr，from Lat．fluxus，a flowing．from fluere，
to How．］The motion or passing of a fidy to tlow．］The motion or passing of a fluid；as，a flux of wuter．－The moving or passiog of anything in rupid
succossion． succossion．

Languagea are in a perpetual fluz，＂－Fetton．
－Concourse；confluence；as，＂the flux of company．＂Shake．
－The flow of the tide，－oppused to reflus． The flow of the tide，－oppused to reflux．
（Med．）Any preternatural flnid evaen
tody，but nny proternatural fluid evacuation from the hody，but nonro especially those that proceed from the ontery was long known as the bloody－fux．－See Diar－ anda，lysentent．
（Chem．）One of those compounds which nre used by reducing or oxidizing agents．Fluxes may be divided nto fonr classes－reducing，oxidizing，doulide decompos－ ing，und simple fluxes．The most important reducing fuxes are the carbonates of eoda and potanh（used rlone or tuixed with charconl），cyanide of pitassium，and bhack flux（a componed formed by throwing into a red－hut one of water）；the nitrates of pot crean of tartar，und priacipal oxiliving finxuan ond a mixture ef that are the carbonate of sumbin and four of carlonute of petarce parte sn excellent double decompusing fux．Thu sumplefluxue act in purifying agonts，romoving und dussolviug ouy mechanical impurity contained in the anhastanco intind upon．Borax，micrecosnic malt，and powderot gluws ar
wased as simule fluxes．Thu limestone nsed in iron－whelt used an simple flaxes．The limestone ased in iron－wimelt ing in a good example of a llux．
Flux．$a$ ．To mult；to fuco；to make liguld．
Flinxation，$n$ ．The nct of imelting fuiur
Hinxatilen，$n$ ．The net of melting，fusing，or making
Finxibilify，n．［lat，fnerihilites，from fuere，to flow
－1ax blile（fir from
＇apubte of a $a$ ．F＇r，from Lat．fluribilis．Soo Fux Flav＇iblemevs，$n$ ．Sunc an YLexinility，$q$ ．v．

 （．Mel．）A thow of blowd or other humor toward gny
organ with greater force than natoral
 quantitiven，Inventeal liy Siswton in likk，Sureton con－ a peint，and decomponambed nt every thentant hy the con to the axie of tho abscisan，and tho other parallel to the
axis of the ordinntes．These velocities are what he called
the fluxions of the co－ordinates；while the arbitrary ve the furimb of the co－ordinates；while the arbitrary vo－
locity of the point which describes the curve is the flux ion of the arc．Reciprucally，the are described is called the fluent of the Ripity with whire it is dederibed by the moving point ；the correspondior absciss is the fla ent of the velocity estimated in the direction of the at sciss，and the ordinate the fluent of the velocity of the point estimated io the direction of the ordiante．The same considerations may be exteaded to the areas bound ed by carve lines，to surfaces and the volumes which they determine，to forces which give rise to motion in bodies，and to the effects which they produce．In fact． the theory is applicable to everything which forms the object of the mathematical or plyysicu－mathematical culas，which are luas of iotegral and differential cal－ lave，superseded the fuxiose，although they are stil enpluyed in working out some problems．－See DIFPER enployed in working out some probledis．－See Differ－

muptared and partially dissolved, and any rolatile oil which may be present are expeiled. Alt kinhs of gesh for instasice, is totally different from beer. It contains a smaller quantity of the alkalies, and there is 15 per cent. mors phosphoric acid than is aceessary for the formation of salts; it contains, also, a little of the fibrine of flesh, and propertionstely abore of the fibrac is rich in
which is less digestible than the former. Feal is gelatine, which is not nutritious, and seldotn contains In all these points it is the reverse of beef. Hard-boiled In all these points it is the reverse of beef. and the same eggs bave hat be said of boiled fish, the soup of which is generally thrown away. In order to make up the Decessary de ficiency of ontritive matter in veal, egor, and fisb, vege per cent., salal 24 per cent., and cabbage-spronts 10 per cent. of their dry weight of salts, alkalies, and nlkalin earths. Vegetable food in generail contans a large proportion of iron. In the human body iron is presentio the
blood, the bite, and other constituents, The jresence of jron determines the color of the hair; and persons of a sanguine temperament have more iros io their bodies than thoss of a lymphatic nature. When the blood is defieient in iron, the physicho preseribes either metal
steul, or chalybeate waters. The presence of this is therefore necessary in food. Prolonged absence from fruits and saccelent veretalles brings on scurvy. Th alsence of the scils which they contain produces thi effect; thas lime-jaice is used by sailors with good cor flavoring foud are mustard, cayenne pepper, black pep per, and varions spices,
premence of $n$ volatile oil. The volatile oils of fennel, thyme, parsley, anise, caraway. luorse-radish, mastard water-cress, de. stimnlate the system, but do not incorpornte themsently fluid maxtures of condiments), in time generally weaken the organs which they at first-timulate. The only weakedtherrgans and vincgar. - Drinks. for the most part, are simply liquid foul. (See Drink.) They niay be divided into the following classes:-1. Anctiaginons, farmaceoss, or sacchar sre a little more butritive than drinking-water. 2 Aronistic or astringent drioks, such as tea, coffee, chocolate, cocoa, \&c. They all contaid principles which act with a slightly exhilirating action npon the nervous aystem; chocelate and cocin contad oil siwl stareh. 3. Acidulons drimks, they allay thiret, kingur-bedr, raspberry-vinegur, dc. They afay thirs, taining yelatine ntod ozmazome, inclading broths and soups. These, when pruperly made, ought to contain sonll the solnble constituents of the substagce from which they are proparel. 5. Elnulsive or milky drinks, such as animal milk, cocoa-unt-milk, almond-milk, \&e. Anfnad milk contaios the ewsential ingredienty of food: the othres are slightly untritive. 6. Alcebolic aud other intoxicating drinks, including in
Table showing the avroge quantity of nutritive matter in 1,060 parts of severuld rurieties of animal und vegelable food.

Fuolv, ( Feasi of.) (Hist.) The name of a festival regu larly celebratetl, with the most absurd ceremunies, buth by clergy and latity in several conntries in Europe, from been introduced in imitation of the Roman Saturnutia, and its celcbration touk place about the same time, the great day being New-Year's day; but the ceremonira were often contunued from Christmas to the last Sunday of Epiphany. At first only the boys of the choir and youngs sucristans played the principal part in them; but afterwarils all the inferior servants of the church, and even laynus, engaged io them; while the bishops and Unreason was appointed, the forms and ceremonius of the church were travestied, indecent songe were sung dancing was carried oll, and sll manner of foolerits enacted. The ass often played an inportant part in the proceedings, being sometimes led towards the altar and having hymns sung io its honor. The Feast of Foole wors condemoed hy several popes and hishops in the 150 th century, and the Council of Basle, in $1+35$, expressed its
detestation of this and weveral other fustivals; but it detestation of this and several other festivals; but it
continasd to be observel in many places dowa to the timst of the Reformation.
Cool's Parsley, $n$.
onlyspecies of the genus Ethusia, order Apiaces , the only species of the genus . Ethasia, order Apiacea, grows
wild in some places in the N. States. It sumewhat rewild in some places in the N. States. It sutuew hat re-
semblus parsley io its folimge nod genoral appearance, so sembles pursley io its fonge ocar, os is frepuently the
that serinus accidents may ocear case in Europe, from its being mistaken for that herb. it being as peisonous plant, similar to hemlock is its properties. When in flower, it is readily known from every other plant hy its umbels wasting gencral invo-
lucre, and having jurtial involucres of three slender lucre, and having jurtial involuce
latue hanging duwn on one side.
Fous, $n$. ppl. FEET. [A. S. fot, pl. fet; Ger. fuse; nllied to Lat, prs, (ir. pous.) (Anat.) That part of the lower
extrenity below the leg upon which we atand und walk. extremity below the leg upon which we stand and walk.
It is compused of tharee series or groups of bones: It is complised of three series or groups of bones: cupy the midulle purtion; and the phalanget, which go cupy the middle porfion; and toe phatanget, whimber
to furm the toes. The tarsal tones ure seven in number to furm the foes. The tarsal bathes tire geven on fibula Above, they are connected form the leed and the binder part of the instep. They are (Fig. 1044), the astrogalus, whichurticulater with the titianud fibula; the of culcis, or bone of the heel; the ns naviculare, or scaphoid tone, on the inner side of the foot, articulating with the mutrugalus; the os creboides, on the outer eide of the foot, articulatink with the or calcis, the three cunciform or Wetheeshumi bothes (the fitermid, midate, nudex of the fint. The motataranl lanea ara five in mumber, ambleling to the class of long boars. They nre connected puaturiorly with the tarsal, anil menteriorly with the fhalangeal hames. One is attacheml to each of the cmineivarge elightly ontwaris on they prowedd firward. Their anterior enoly furm the linkls of the feen. The first metatarmal bonuls the shortent and strongent, while the second
ta the largent, the otherm all decramiog in length
 ther nuterine jortiom of the thateqp. The phalanges, of thes, "xivpte tho great wite, whith has only two. The Hypry wne, which are the longent nith fargent, ore nomed torlur, the unguet phatangen. The inones of the fuent
 metatanum, are firnily comberted toge ther, No thut they

possess a considerable degree of elasticity. They ars bound together in various
ligamente, one of the principal of which is the plantar liganent, which is of great strength, and of great throagh the onder surface of the heckbone near its extremity, forward to the ends of the metatarsal bones. The bovements of the foot, which are permitted liy the connecting ligaments, of puscles. The princinal movements are, (i) thut at the ankle, formed by the tibia and filmla with the nstregalus, by which the foot is bent nod straightened; (2) between the astragalas and os calcis, hy which the foot is rolled juwards and outwards; (3) between the first and second range of tarsal hober, admitting of a very sighit of the foot may be sumeof the foot may be seme-
wlat increased or dimisisbed. Besides these there are the less complicated movements of the motatarsal and phahangeal bones. The foot, paturally a brantiful structure, is uswally bo mach interfered with in civilized life as to be deprived ef puach of its beanIts movemente are imperl Its movements are imperi-tight-fitting boots; while in place of the boots being in place of the boots to the shape of the fert, the feet ar made to conform to the shape of the boots. The consequences of which nre corns, bunions, cold suffer in the present day. Attention hus hem, nome years ago, callen th this subject lyy Protersor Sieyer of Zurich, who pathlishesl a pamphlet, entithed iWhy the shoe pincher; a contributim fo oppled Anutumy. Which perusal.
( 1 rok.) In Greek and Latin poetry, a metre, or moasure, composed of a certain number of lang and short eyllibles. Sone are diesyllalic, consisting of two feet as the spontee, iambus, trochee; and some triayllubic as the dartyl, anapeet, tribrarh. These are what ure called simple fect. There are others, cousisting of four five, or six syllables, which are recknsed atonhle or coni pound feet, but which are commonly resolved into sinof foet which it contuins, or from the fisot which pre of feet which it comace, or intaining six feet pentamer ter, containing five; dactyllic, from the dactyl being the prevailing foot; iombic, the iomlita.
(Arith.) A mensure of length, consisting of 12 inches, or 36 barkeycorns laitl end to ent. It atmo expremers surfuce rand soliblity. A square foot is the same musure both in length and brealth, containing $12 \times 12=1+4$ square or вuperficial incluss. A ctinic or mend fent is the sume measure in all directione, or 12 inches long, lirual nad deep, containing $12 \times 12=14 \times 12=172 \mathrm{~N}$ cultic inclues to the solid or cubie foot. - As this term is cmployed in almost nil huguages as a linear memanre, it foot Thengh the denomination in the same, the nuras -

(Mus.) A term mule wse of th the kalase wity an in poctry, denoting a short meloslic flgure of putee with only one accout. Feot is aleo now beginning to be ueed in speaking of the pitch of sounds. The tiermana luro always usell the word Fuzton in representing the piteh of the different atopn of un organ, ench na Irincipat

Look on my forces with a gracions eye." - Shake.
(Mech. and Prys.) Any canse which is capable of producing motion in matter, or of stopping or alterint its direction wheo produced. Every visible particle of mat-
ter is under the influence of serveral forces, exerted upon it both by distant and by adjacont particles, anil upon Which it acts in return; for the action of one body on ter upon the former, of the same intunsity, is no oppoowing to these forces, and upon their halance the appar ent state of rest in others is depuntent. According Sir Joho Herschel, the origin of the idea of force mo
be referred to the consciousness of each individual. I says: "We are conscious of a power to move our ow limbseant ly their is effect is the result of a certinin inexplicable process even when such exertion produces no visible effect, (a when we pr'ss our two hands violently together, so a just to oppose cach other's effort,) westill perceave, by the fatigne and exh.unstion, and hy the impossitility of mainthiting the effort long, that sodiething is going on with In us, of which the miod is the agent, and the will the determining cause." In the case of $P$. exerted by the
right hatad, and met by an equal force from the left, the right hatud, and met ly an equal force from the left, the two, acting in opposite directions, exactly neutralize
each other, ind may le sadd to be in equitibrio, and the each other, ind may be sadid to bo in equilibrio, and the
effect is called pressure. As this force is fonod to have elfect is called pressure. As this force is found to hase mals, it is called muscular or soimal force. This force can be communicated to ioanimates matter, as when a stuoe is projected from the band. Huscular force may tiod, as when a stone, by means of assa by continuel acly arted upon by the same arm, it will at leagth the projected with an intensity of action capithle of producin very violent uffects. Force transferrel to moviog masse of matter is called machanical force, and by multiplying the yuatity of natter in a body by its volocity, wo ar rive at its momentum, or the quantity of force which it The capable of excrting upon other hodies opposed to it. province of Dynamics. In meshanics, the term decour puadion of forces signifies the samu thing as resulntion of forces. Any force mity be decomposed or resolverl into a number if furces, atd the original force will to equal to the resultant of those forces. Thus, if the given force be rupresented by the dingouil of a parallelograth, it can he resalycd or decomposed into wo forcen of like intensity and direction, represented by the two stucs of
the parallelogram. Any ono exurting muscular or unithe parallelogram. Any ono exurting muscmar or manhy other furees appertaioing to inanimate mattes. It lifting a lamp of metal, stone, or other heavy substruce is called wright or grarity. On prexsing with the arm on a strong opring, atather opppsing force is olserverd approw hand othors to recede from eauls other retain ing them in their eccond position agaiast an opposing forve; tho former are callend forers of cettruction of und the

venerated by the Romans and other ancient peoples
temples being often erected and sarifices urdined it
their honor. This nay becoosidured their honor. This nay beconsidered one of the greastes
reasons for the Draids liviog in then much mors sacred to dwell uoder trees was thouglit chump - in the open field. Forests supplyan en pleia many oecessaries. Timber and fiel, medicinal wand nourishiog plants, all trace their soarce to the laxuriant forest, which, moreover, affords shelter to the honseless
apd a field of occupation to and a field of occupation to the hunter. Eiropean forests are mostly composed of oak, elta, beech, poplar, ish alder, phase, willow, hme, and birch; not to eppenk of the ammbers of wild-apples, pear, and other frnit-trees besides pine, fir, and cypress in profusion, with all specive
of brushwood and vines. In Norway, the forest-land extunds up to Drontheim, which is ia, latitade $63^{\circ}$ north. Switzerland is well wooded, sad oaks and firs are forth. at a level over 4,000 feet above the sea. Frauce hat soone fine examples, her varicty of climate being favorable to betong to a mach warmer climate: the forch, indeed, Ardennes, Compeigne, and Fontaineblean may bo mentrened as instancus of the expansey she has coovered with
Italy, the plains of Ravenga aftord o wide trees. In Italy, the plains of Ratrenga afford a wide scope
there $v e r y ~ e x t e n s i v e l y ; ~ m o s t ~ o f ~ t h e ~ o a k, ~ t o o, ~ n e d ~ i n ~$ there very extensively; most of the oak, too, nsed io
the Eoglish navy for shipbnildiog purposes, comes from Thmringer-Wald, Spessurt, stchawald (Black Foreat) teat, and distiognished for pictnresquenessideralile ex forests are cultivatud and preserved with the stre, th care by the governaments of the different statestrictest sia, however, bears away the palta for lier abundanc
of forests, and some of the tiaest timlur of Corests, and some of the fiaest timber is the nord
comes from ber ports in the B.tlic. The districta of Tver and Novgoroul are regalarly covered with wood and the forest of Volkousky ie considered the largest in Eurnpe. Puland, too, $\mathbf{r}$ comblea Russia in this matter conntry. But for the kiog of second best well-woodet look toonur coutinent, where, both in the the reader must the vegetation appears to pooseess no limits. In the U, extent, are gradually disuppearig., thrump the imens gration into the conatry, and the diffusion of the set thers; but io suuth Asoericn, the whole of the valley of the Anazon, which embracea one-third of the entire area of that country, is ons vast forest. It would be impossible to five an acconot of the varions descriptions parcntly withont limit, fund the size; for they are apparcontly withont limit, and the size of the individnal trces is gencrally stupenturs. England also, in early
tioues, wats covered with forests, which and being waste land, came to be regarded as thequently, a of the erown; ant, as aboundiog with as the property kindo, were carofilly protected : all persons beiog probilited from hunting in them but the king or peng pronuthorized by him. Affer the time of the Coogncat it forents came to be guarded with greater strictuess, their number was increased, and their boands entarged, and trespussors wore punished with greator severity, Fi
nally, a system of laws and conrta for their admio istrition was ewtablished, by which not only all offence living npen these forents were tried, but all peroon is sath to lave propserties governed. The fonquiror 781 parks. A chase is a smaller kind of furest, not mahject to the forest laws, and which of furest, no latuds of a subject, whereas a forest can onty be in th the crown. A park differa from a forest or cliase in bein of amaller extent and ioclosed. The Cor chase in bein eaid to have loved the red decr hss if he had twent tho 2 futher, puacted very ouvere penaltios againat treaphesors, and the killing of a ntag or bour was visited with low of sicht. His enevensors were knilty of still greater crueltion, and it is said that to kill any of the beaste of
chase within a forent was us pemal Vast trats of conntry were depmonlated in a man croate new furests, or to externd the linated in order ti and under the color of furest law the mon cruel onem horrid oppreasions weris extreisech. At kerigth, however many of theno harishijn were romorend hy tho curtuer foresta, obtained in the $9 t h$ year of II enry III., the imimnuiting of which. says Blackntene, wern "it warmly contemuled for, and extorted from tho king with warming dificulty, in those of the Mignas Cyarta ituelf." This law, etil unreqnelem, decluren that " no man from lawee-
forth shall lowe either lifo or member for till ther; bat if any raso ho taken and convictel filling our of our venison, he shall make a gricuons fine if the ling angthing wherceof; and if tho have nothing to lonen, he nhall be ituprisonedi a yoar and a day, und aftor that

As night approsches, the experienced ineects to whom the care of the precious ova is intrasted, remove the gege they naturally pusbecs. Nor dues the care of these tender nurses ceaso when the little suts come into life. At pight they are carefilly stowed nway in the inger nost chambers of the Dest, every aperture beitag closed to prevent the ingress of cold nir. But as soon as the rays of the moroing suo fall upon the sarface of the nest, the workers bnsily commence carrying their infrots to the upper chambers, where, close inder the roof, they nasy enjoy the zenial warmth. During their grabthe , the themach. When the erubs wre fallerown they the cocoons of a menilionons textire, and of a tirownistiwhite color, in appearnace not unlihe larleycorns, for which, indeed, they were miotaken by early oliservers. Hence, doubtless, noose the belief that the insect lidid up a store of grain in the summer reasus, to strve for its snpport in the winter. Salys the Rev.J. G. Wiorl: "Ante do nett, as has been frequently suid, lay up atores of corn for the winter, for they are in a state of worpidity during the winter months, and require no food. Moreover, an ant would find as much difficulty in eating und digesting a grain of corn as we mhould in devouring a truss India, that laid up a large ntore of millet-keed; and it is possible that othor ofecies may huve the same lushit. The regetable aubstrace which ante nppar chindy to uee an food, is sugur, und to this, wherever it in to be found, they kiepit to lue guided by a very acpute sense uf smell. Honey-dere, the kaccharine excrescence of the aphides, is a fuvorite food of many apecies. Nut unly do the ants climb plante on which aphides are to le Gundl, but should they hind me crentore nud not bik Eaccharino produce, they will, with their antenthe, pat the aphins on either shle of the mblotben whin flie desired stry is

 Nourt, $n$. [Pr, fort: It. forte; Lat. forfis, ntroug.] (Mit.)保 town, to command my of the approaches to it. Forts
are also frequently erected on the sea-coast, for the de-
fence of certain pusitions, sud are garrisoned by a suall fence of certain positions, sud are garrisoned by a small
body of troops. Althongh they do not inclose a space of any great extent, yet they are strungly constructed, and, being placed in commanding situations, often form un importunt line of defence. They are geberally quadrilateral, with bastions or demi-bastions at the ankles
but it depends mainly on the position they necupy but it depends bainly on the position they occupy,
whether they are triaugular, square, pulygonal, or in whether they are triaugular, square, pulygonal, or in
the form of a crowh-work or star. They cousist for the most part of a rampart, sarroanded with a ditch and Glacis; but in sonle cases an out-work is constructed for assailed. Paris is completely girdied with a chain of carefully planded forts, mostly pentagonid, ia the shape of the enceinte, and situated at distances varying from a mile to $21 / 2$ miles from the inner line of bastions that
encircle the city. Cherbourg may also be cited as an example in wbich a town is effectively protected from H'tack by sea or land by a chain of detiched forts and redoubts, which is doubled on the south-west side of the
town. - $\ln \mathrm{N}$. America, generally, the name is also aptown. - In N. Aberica, generally, the name is also ap-
plied to a trading-post io the wilderness with reference to the indispensable defences, however slight, against the surrounding saveges. It has thus beon employed civilization in the dosert - and snch is generally the civilization in the desert, -and snch is generally the
origin of the numerous places to wbich the name Furt is prefixed.

By way of fort/fication and antidote." - Hooker.
(Mil.) The art of constrinctiug worlis of defence and offence for the protection or roduction of any important town or position. such worksiare out ander his direction and snperintendence. They are commonly dividel iato two classes, respectively known as permuenent fortifications a ad field-works. Under the monner nil works are included that are coostructed for be detence of a tow $\quad$ laid out and built with a view to durability and the relaid out and built with a view to durabinty and the re-
sistance of an attack, whegever it may be mule; while, sistance of an athach, whenerer classed that are iut"-nded to serve a temporary purprose, such as siegs-way ks and meat hastily thruwn up for the promectinu of an army in the fiedd, or to check the advance of an enenty on ut important strategichl positioo. Tbese works differ mainly in the manner in which they are built, the ramparts and parapeta of peronaitit ; the terre-plein of the rampart on
which the guns nre worked, the checks of the entira Nures, casemutes, lomblefrouf buillings for maguzituse worke chasint of monthis of rarth formed of that which is thrown up out of the diteh in font, having th. ram jurts and embrasuriss rivetted with mods of turf, fiss. cines, kations, ntal sund-bugs, the tefrephein lur the
 principal works in rach chase, und their component parts, are motuesl under their respective bematimes, at nccount being given in all ceseres of the peonlar purgoses for which they perve and the method mhented in their
 ponnierk, Coybasd Way, Ditei, Hlacis, Flhcile, Foht, Levente, RAvidiv, TES hlle, TBAyEhse, BhDoz-Hzid,
 Thescin, ke.) It will, therefore be only nectssary, in the presentarticies of the science from the emorliest ages to the present titue. The existing eystem of fortificution doubtless fonnd its origin in early nges, in the formation of angs, for the purnmon of affording the immates and their
 rawling fue, a sate lecing make in one part of the rampart for the ingress and ecress of those that dwelt within it, with a movable bridge fir the passuge of the diteh
This method was parsueal by the thats aum Britens in Thia method was pursued by the thands and britons in
the time of ©'asar; and they miled wtrongth to the the time of "'assur; and thry mbled atrongth to the earthen monnd by throwing it up agatist a ntoe kade of 8tunt stakes or piles, which were driven into the earth houghs and brumes of trecs, The field-works of the Rougha and branches of trecs. The held-works uf the of the sumare tribes of Contral and Western घuroper mainine in matay parts of Emope to this day ua a tost mony to the skill of the lioman soldiers in furtifying even temporary campw, and the great strength of their works. But the tield-works of the Gauls ant Britent consisted of nothing more than their cars and wagong disposed around the cannp, in the form of a circle, nhid treagthened by an abuttis, or barricalle, formed of thi bruncbes anil tranke of trues. At a very early perionl tone the place of the simple ramprts of carth, for the defensive works thrown up nround "fenced citics:" numb these were furnished with lattlements nod minchicolntions (see Macutcolation) for the protection of the tions (see Macnicolation) for the protection of her ing the besiegers who might attempt to undernine the rampart. The spaces hetween the bitthements, and the battlements themselves, were subsequently mothoce into the parapet-wall and embrasures, as we duw hav them, on the intrinduction of cannon. Examples of enrly fortifications are to be fonad in the remains of the Cy ciopean walls that once surronmied the old tireck cines lieen the firat who regnlarly fortified their cities with stone walls: fut, however this may be, it is certatin that the cities of Ecypt, and the great cities of Assyrin Bubylon and Nineveh - were girdled with fortifications of marvellons strenth and size, on which several chariots could be driven ulreast of each other. Until tho

Foundinn $;$. The process of producing any article by causing molten netal or plaster of larre to ruu in a liquid state into a mould of the reyuisite form, which
is made in varions ways, and of sulstances beat strited is made in varivos ways, and of substances best suited for the reception of the liquid material that is to be
poured into it. The process is applied to the manufacpoured into it. The process is applied to the matufac-
ture of articles in iron, bronze, bell-metal, lead, stecl, copper, purculain, plaster, and cement of various kinds. The metlud of foundiag or casting cannons in iron and process adopted in easting etatuee is plaster, and making ornamental pottery und Lusts in Parinn ware, differs castings, which they respectively Sccleteas), and the pront article devoted to a brie account of the method adoptel in founding iron cust inger of great size, and bells and stances in bell-metal and
 onlphnr, and water that may exist in it, it is thrown inte an ehormwas furnace (see Blast-ptanaces, Iron Mane FACTURE) with a quantity of coke and linestone, the latter of which acts as a flue to the ore, nad promotes the melting of the iron. The following proportion is gemerally observed, namely, a ton and a half of coke and o ewt. of limestone, broken in very smail pieces, to every
ton of ore; but if pig-iron be used, or iron that lisa been extracted from the ore, the addition of limestone is not necessary. Whet this mixture is in the furnace, a strong current of air is dirncted against the glowing
mass, and the metal sinks to the bothom of the furnace learing a quantity of seorn, techaically ealled "slage, behiod it, whon the rent at the bottom lian heen spened and the molten Hliid allowerl to eacoupe. The modit of the article to be cast in gencrally nade it wowl, and from theas manlele moutlis are constristed, being made mixed and kneaded with a little water. If the article is to be made in a solid piece, there is not buch dithi-
culty in making the monlid, which ea gemerally fimhoned in two piecen it the clusting lor ryhndrical in shaje, or it is to be cant hollow, a core is furmuel, to vernapy tha grvater part of the intertur of the moulli, leaving a corthe thual and eserywhere betwed the laner surine of which gises the exterant form to the cheting, uhd the lutter the internal form. To make the core, a quantity of bas ur chay io presial monto the ateuld, or parte of the
 then built together, sud the internat cavity filled with sand, or a compomition mude for the vorpene. The ex-
terior mond is then takez off, tad the wax or elay teriur monid is then taken off, tud the Wax or elay core uround which the mouht in sulsempently lailt up. bring prevented from touchitig it by elopm that are mould nind the core. They ure then thoronghly dried by being exprosed to tho action of lheat in "1 dryingfrom momsture, which would to innure perfect frcedota an exploaion at the entratice of the metm. As seman ab all parts of the mould are dry. they are built together and surrithaded by batid, which is carefully banked the weight of the metat when it entero: but if the casting he of considerathe tize, it is gencrally luried in a pit below the level of the furunce, which is fitled with in wach cases the mould wad corn wre strencthened hy bary und hanis of iron, wheh have been intrulaced dur ing the provere of making them. Somethers the moulds are packod with kand mito transes of irum or castingtho . When all id ready, the furnace is openext, aut auls medy is anwed to ron into the monld monk chatitance from the furnace, and the consing be of small size, it is carried from the furmace liy meth in large iron puts or crucibles. sumicicat time is tren given to ullas the the iron, if newestary when me mouht is broketh off, and ness removed by filing, \&c. The alove is an outline of the process nsed in muhing costuggs if irun, and it is pretty hearly the same for costimes mall kinds of netal, with some slight difference, that is requared either by the form of the article (sie suets), or the jecaliar netat of which it is make. In chsting large thelle fut charches, cathedrals, and clock-tow ore, and groups of figores, or
gtatucs of great size, very largo fornacea are requiros otatucs of great size, very largo fornace are required, as the whole of meta used in the castimp mant bo which the ratl isto the modid at one time. The pit in which the bed is cast is made near the furmate. The position of loata and hurse-dnang, which is carcefully farhcoation the shape of the interior of the befl. coating of compositions is then added, ane frumulher ing to the other, and this is carefully moulded to the form of the exterior of the bell, forming what is called the model. More thin-dust io the-n mppled, mind on the model a thiru coasting to laid, called the shell, whick This shell is the carefully tak exterior of the lielt. This shelf is then carefully taken of and the model removed, after which the Bledf is built ipl rund the core,
 been melted in a furmace heated with woed, imbtead of coal or cuke, is then alloncel to run into the monld. After castitg, the tone of the hell is duly rogulated (see Bell). The methond uscd in custing lironze statues je similar to that adopted for castiags in iros and bellmetal: but the composithon of which the mould and core are bude is different, cousibting chefly of a nixtore of
plaster of Paris anul brick-dast. It is unwecesary to plaster of Paris anul brick-dnet. It is unnwerneary to make large brunze castings in oule plece, as they can be
made in parts, which are afterwards sulderil together. The compusition of bronze is given unden ite proper head-

Fonind 1
Onist lisist, $n$. [From frand, find.] One that on found;

Fonindling-lıow bilai, $n$. A charitante inktitution ctildren that have lwend alanging ujp of foundimgs, or
 tion of childrea, either liy actnal violence or through exposure in the strects of fighways and their cetaland 0 des tice und is exposurcolinaren was afrequent practher Platon nor Aristotle condenin it: they comtent themselves with laying down coneral rules for the prowervilum of tho henlthier and strunger at the expenee of the thore wrukly. Thebes was the only state of ancient Greme that is known to have forindens lyy haw the exposure of chihiren. Abandoned children were declared by law to be the slaves or almolate property of those who hronght them u]. The practice of rxposing infants new an atoo
to have fruvaled anong the Germanic mations before the introduction of Christinnity. With the furend of the introduction of Christianity. With the apread of
Christianity, different feetengs began to prevail on this subject, and the oxpmasurecof infinta wan forbinlden by the enpperors Viluntinian and (iratian. At the bame time, the efricter luws that came in force concerning anurriage, and against coticubimage, rendered women mpreanxious than to infantsonceat thir shame, so that, in fact, ha-danger creased thum dimininhud: unit heuce Gibhan has some reason to ajoak of chitd-exposure as one of the most
stubborn remnants of heathendom. So early as the 6th century a species of fuundling hospital is said to have existed at Treves, the then bashop of that place permittiog children to be deposited in a marble basia which the members of the church. The first well-anthenticated instance, however, is that established at Milhan, in 757 by the arch-presby ter bathens. Subseqnently, found liag-hospitals were eatablished at Mootpellier in 10, 0 , at Enbeck in 1200, at flarence in 1317, at Nuremberg in Innucent IIL. when rebuilding the oreat hosptal of Innocent IIt., when rebuilding the great hoejpital of
Santo Spirito at Rome, allotted a portion of it for the reception of foundtiogs. This syatem prevails in France, Spaia, and Italy, anu in general in all Rooran Catholic countries in Europe, whereas in Protestaut couotrice it is nut looked upon with favor. The principal ohjection that has been raigod againat foundling-hospitals is, that they tend to oncourage illegitimacy; and the great ar gument in favor of them is, that they have the effect of preveoting child-murder. The question is one of very great dificulty ; but the prevailing opinion in this conning, on the whole, more pernicions than beneficial. The mortality in founilling-lyospitals has always been very great, though the evil has in some meaynre been mitigated in more recent tiwes by meane of improved monnagement and the practice of giving out chitdren to the gursed. The nsual mode of depositing chnldren in the hospital is loy means of a turniag-bux fixed in the wall
in which the child is laid, ant, on a bell being rung, it in which the child is laid, ant, on a bell being rung, is takea in by one of the watchers. The propartion of
illegitimate children in Paris is abont one in every three births; and of the total nomber of illegitimato chilifen lianthospital, wherg more than one-hall of them die be fore they are a year old. In this conotry public opinion hore they vare a year old. In this conotry public opinion foundling-huspitals. In Philadolphia, abandoned chil dren are taken in charge by the Guardians of the Poor The greater number of them, auch is generally their condition when found, die anon after removit to the hospitals; but such as survive are well provided for ly
adoption in reepectable familiea. In New Vork such aduption in reepectable families. In New Vork such

Fourier, Fanygors Canales Mariz, (fomt'pai,) the inventor of the co-operative system, b. et Beanugon, 1768. Ile was son of a clothier, azd whs hrought up to mercantile employment at Lyons and Marseilles, The agitations of the first years of the revolution led him to reflect and speculato on tho evils which affict society and possitle remetlies for them, and in 1806 he announced
his discovery or theory in a volume entitled. Thforic his discovery or theory in a volume entitled. Thforie des Quatre Mouremens it des Destinés Génirales, which, after exciting a nine-daye wonder, was forgoten. It he began to publisht in $18,2,4$. the firat jurtiou lwits entitled, Traits de C'Asemeiotion Domertigue et Agricute No notice was taken of it by the press or by the pullic men to whom Fourier aent copies, nor dud his compendium entitled, $L$ - Noureau Alonde Industriel et Siecictaire, find a better reception. By a Fevore nttack on the principles of the st. Simoniunt and Owenites in 1831, Fourier gained attention and attrivetel disciples, and he soon after hegan publishing a journal, "La Phalnage," for the propagation of his vicwe. She attempt made to give practical shape to them came to nothing, but the crowing for realization of his idea- a of social organization - is whle-apread and decp-binted especially in France. Fuurier puhlighed various other eapecially in fance
 tem of sucialism promulguted liy Charles Fonrier (17\%2183 ${ }^{-}$), anil which differs tuaterially from the systems of comnuniom etrictly to callead. It profespes to be hased upon matural laws, and to be foundel on cmicnlatons which he matinamen to be the commergart of Newtons physical nystem. This system, unlike contumism, thes not, it theory nt least, withdraw nay of the mutives to excrtion whith exint at prement, nor dops it contemplate Fourierists, there is marcoly any kind of waiful latur which is naturally unil mecossacily disagrueuble, unlers It bo either rogerolid as dishonomitile or is immodorate in degree, or destitute of the stimulus of synimathy aud eninlation. They, therefore, enteator to atrengethen und funter those motiven for exertion that are naturally inherent in man. Sochety was to be formed into anewciatione, or phatansterice, eoch comprishog dor families, or $1,8 \mathrm{~h}$ perans, nimburs hronght out by very careful calculatians. The whalantery was to incluche everything In atroteure nind character which eonhlil gratify the finctions of the mumbers werie to fic intallilly alluated flicough a distrilmtion by which each promen was to be art preciugly to that occipation in Hfe to which his pastalona aut propenadtum fliectet him. fifo wha thum tu the a perpetual enfoyment; and lahor, inateat of lieing a tauk, wne to lue in murh a monrce of enfoynuent ns the jursuite of the linnter or the angler. This property of ther nuwn lation was to low leeld in 1.12d ahares, and the whinle products were to be dividel into twelve parts: of which five wery to go to lalor. four to capital, and thren tu) nkill or talent The capltat of the community may
